This is a package for running H2O via its REST API from within R. To communicate with a H2O instance, the version of the R package must match the version of H2O. When connecting to a new H2O cluster, it is necessary to re-run the initializer.

This package allows the user to run basic H2O commands using R commands. In order to use it, you must first have H2O running. To run H2O on your local machine, call `h2o.init` without any arguments, and H2O will be automatically launched at localhost:54321, where the IP is "127.0.0.1" and the port is 54321. If H2O is running on a cluster, you must provide the IP and port of the remote machine as arguments to the `h2o.init()` call.
H2O supports a number of standard statistical models, such as GLM, K-means, and Random Forest. For example, to run GLM, call `h2o.glm` with the H2O parsed data and parameters (response variable, error distribution, etc...) as arguments. (The operation will be done on the server associated with the data object where H2O is running, not within the R environment).

Note that no actual data is stored in the R workspace; and no actual work is carried out by R. R only saves the named objects, which uniquely identify the data set, model, etc on the server. When the user makes a request, R queries the server via the REST API, which returns a JSON file with the relevant information that R then displays in the console.

If you are using an older version of H2O, use the following porting guide to update your scripts:

**Porting Scripts**

**.addParm**

Todo: No objects in this file are being used. Either remove file or use objects.

**Description**

Append a <key,value> pair to a list.

**Usage**

```
.addParm(parms, k, v)
```

**Arguments**

- `parms`: a list to add the <k,v> pair to
- `k`: a key, typically the name of some algorithm parameter
- `v`: a value, the value of the algorithm parameter

**Details**

Contained here are a set of helper methods that perform type checking on the value passed in.
### .collapse  
*Helper Collapse Function*

**Description**

Collapse a character vector into a `,`-sep array of the form: [thing1,thing2,...]

**Usage**

```
.collapse(v)
```

**Arguments**

- `v` Character vector.

### .h2o.doGET

*Just like doRawGET but fills in the default h2oRestApiVersion if none is provided*

**Description**

Just like `doRawGET` but fills in the default `h2oRestApiVersion` if none is provided.

**Usage**

```
.h2o.doGET(h2oRestApiVersion, urlSuffix, parms, ...)
```

**Arguments**

- `h2oRestApiVersion` (Optional) A version number to prefix to the `urlSuffix`. If no version is provided, a default version is chosen for you.
- `urlSuffix` The partial URL suffix to add to the calculated base URL for the instance
- `parms` (Optional) Parameters to include in the request
- `...` (Optional) Additional parameters.

**Value**

A list object as described above
.h2o.doPOST

Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided

Description

Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided

Usage

.h2o.doPOST(h2oRestApiVersion, urlSuffix, parms, ...)

Arguments

h2oRestApiVersion
  (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.
urlSuffix
  The partial URL suffix to add to the calculated base URL for the instance
parms
  (Optional) Parameters to include in the request
...
  (Optional) Additional parameters.

Value

A list object as described above

.h2o.doRawGET

Perform a low-level HTTP GET operation on an H2O instance

Description

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

Usage

.h2o.doRawGET(conn = h2o.getConnection(), h2oRestApiVersion, urlSuffix, parms, ...)

Arguments

conn
  H2OConnection
h2oRestApiVersion
  (Optional) A version number to prefix to the urlSuffix. If no version is provided, the version prefix is skipped.
urlSuffix
  The partial URL suffix to add to the calculated base URL for the instance
parms
  (Optional) Parameters to include in the request
...
  (Optional) Additional parameters.
Details

The return value is a list as follows: $url – Final calculated URL. $postBody – The body of the POST request from client to server. $curlError – TRUE if a socket-level error occurred. FALSE otherwise. $curlErrorMessage – If curlError is TRUE a message about the error. $httpStatusCode – The HTTP status code. Usually 200 if the request succeeded. $httpStatusMessage – A string describing the httpStatusCode. $payload – The raw response payload as a character vector.

Value

A list object as described above

Perform a low-level HTTP POST operation on an H2O instance

Description

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

Usage

.h2o.doRawPOST(conn = h2o.getConnection(), h2oRestApiVersion, urlSuffix, parms, fileUploadInfo, ...)

Arguments

conn H2OConnection
h2oRestApiVersion
(Optional) A version number to prefix to the urlSuffix. If no version is provided, the version prefix is skipped.
urlSuffix The partial URL suffix to add to the calculated base URL for the instance
parms (Optional) Parameters to include in the request
fileUploadInfo (Optional) Information to POST (NOTE: changes Content-type from XXX-www-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file")).
... (Optional) Additional parameters.

Details

The return value is a list as follows: $url – Final calculated URL. $postBody – The body of the POST request from client to server. $curlError – TRUE if a socket-level error occurred. FALSE otherwise. $curlErrorMessage – If curlError is TRUE a message about the error. $httpStatusCode – The HTTP status code. Usually 200 if the request succeeded. $httpStatusMessage – A string describing the httpStatusCode. $payload – The raw response payload as a character vector.

Value

A list object as described above
Description

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

Usage

```
.h2o.doSafeGET(h2oRestApiVersion, urlSuffix, parms, ...)
```

Arguments

- **h2oRestApiVersion** (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.
- **urlSuffix** The partial URL suffix to add to the calculated base URL for the instance
- **parms** (Optional) Parameters to include in the request
- **...** (Optional) Additional parameters.

Value

The raw response payload as a character vector

Description

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

Usage

```
.h2o.doSafePOST(h2oRestApiVersion, urlSuffix, parms, fileUploadInfo, ...)
```
.h2o.locate

Arguments

h2oRestApiVersion
  (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.

urlSuffix
  The partial URL suffix to add to the calculated base URL for the instance

parms
  (Optional) Parameters to include in the request

fileUploadInfo
  (Optional) Information to POST (NOTE: changes Content-type from XXX-www-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file")).

... (Optional) Additional parameters.

Value

The raw response payload as a character vector

---

.h2o.is_progress  \textit{Check if Progress Bar is Enabled}

Description

Check if Progress Bar is Enabled

Usage

.h2o.is_progress()

---

.h2o.locate  \textit{Locate a file given the pattern \texttt{<bucket>/<path/to/file>} e.g. \texttt{h2o:::.h2o.locate("smalldata/iris/iris22.csv")} returns the absolute path to \texttt{iris22.csv}}

Description

Locate a file given the pattern \texttt{<bucket>/<path/to/file>} e.g. \texttt{h2o:::.h2o.locate("smalldata/iris/iris22.csv")} returns the absolute path to \texttt{iris22.csv}

Usage

.h2o.locate(pathStub, root.parent = NULL)

Arguments

pathStub  relative path

root.parent  search root directory
Map of operations known to H2O

**Description**
Map of operations known to H2O

**Usage**
.h2o.primitives

**Format**
An object of class character of length 39.

Capabilities endpoints

**Description**
Capabilities endpoints

**Usage**
.h2o.__ALL_CAPABILITIES

**Format**
An object of class character of length 1.

Check H2O Server Health

**Description**
Warn if there are sick nodes.

**Usage**
.h2o.__checkConnectionHealth()
.h2o.__CREATE_FRAME  H2OFrame Manipulation

Description
H2OFrame Manipulation

Usage
.h2o.__CREATE_FRAME

Format
An object of class character of length 1.

.h2o.__DECRYPTION_SETUP  Decryption Endpoints

Description
Decryption Endpoints

Usage
.h2o.__DECRYPTION_SETUP

Format
An object of class character of length 1.

.h2o.__DKV  Removal Endpoints

Description
Removal Endpoints

Usage
.h2o.__DKV

Format
An object of class character of length 1.
Export Files Endpoint Generator

Description
Export Files Endpoint Generator

Usage
.h2o.__EXPORT_FILES(frame)

Arguments
frame H2OFrame

Inspect/Summary Endpoints

Format
An object of class character of length 1.

Import/Export Endpoints

Format
An object of class character of length 1.
.h2o.__JOBS  Administrative Endpoints

Description

Administrative Endpoints

Usage

.h2o.__JOBS

Format

An object of class character of length 1.

.h2o.__LOGANDECHO  Log and Echo Endpoint

Description

Log and Echo Endpoint

Usage

.h2o.__LOGANDECHO

Format

An object of class character of length 1.

.h2o.__MODELS  Model Endpoint

Description

Model Endpoint

Usage

.h2o.__MODELS

Format

An object of class character of length 1.
Model Builder Endpoint Generator

Description
Model Builder Endpoint Generator

Usage
.h2o.__MODEL_BUILDERS(algo)

Arguments
algo Cannonical identifier of H2O algorithm.

Model Metrics Endpoint

Description
Model Metrics Endpoint

Usage
.h2o.__MODEL_METRICS(model, data)

Arguments
model H2OModel.
data H2OFrame.

Parse Endpoints

Description
Parse Endpoints

Usage
.h2o.__PARSE_SETUP

Format
An object of class character of length 1.
### .h2o.__RAPIDS  
**Rapids Endpoint**

**Description**
Rapids Endpoint

**Usage**
```
.h2o.__RAPIDS
```

**Format**
An object of class character of length 1.

### .h2o.__REST_API_VERSION  
**H2O Package Constants**

**Description**
The API endpoints for interacting with H2O via REST are named here.

**Usage**
```
.h2o.__REST_API_VERSION
```

**Format**
An object of class integer of length 1.

**Details**
Additionally, environment variables for the H2O package are named here. Endpoint Version

### .h2o.__W2V_SYNONYMS  
**Word2Vec Endpoints**

**Description**
Word2Vec Endpoints

**Usage**
```
.h2o.__W2V_SYNONYMS
```

**Format**
An object of class character of length 1.
The H2O Package Environment

**Description**

The H2O Package Environment

**Usage**

```r
.pkg.env
```

**Format**

An object of class `environment` of length 4.

---

H2O <-> R Communication and Utility Methods

**Description**

Collected here are the various methods used by the h2o-R package to communicate with the H2O backend. There are methods for checking cluster health, polling, and inspecting objects in the H2O store.

**Usage**

```r
.skip_if_not_developer()
```

---

**Description**

Used to verify data, `x`, `y` and turn into the appropriate things

**Usage**

```r
.verify_dataxy(data, x, y, autoencoder = FALSE)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data</code></td>
<td>H2OFrame</td>
</tr>
<tr>
<td><code>x</code></td>
<td>features</td>
</tr>
<tr>
<td><code>y</code></td>
<td>response</td>
</tr>
<tr>
<td><code>autoencoder</code></td>
<td>autoencoder flag</td>
</tr>
</tbody>
</table>
apply

## Not run:
if (Sys.info()['sysname'] == "Darwin" && Sys.info()['release'] == '13.4.0') {
  quit(save="no")
} else {
  h2o.init(nthreads = 2)
}
## End(Not run)

apply

Apply on H2O Datasets

Description

Method for apply on H2OFrame objects.

Usage

apply(X, MARGIN, FUN, ...)

Arguments

X an H2OFrame object on which apply will operate.
MARGIN the vector on which the function will be applied over, either 1 for rows or 2 for columns.
FUN the function to be applied.
... optional arguments to FUN.

Value

Produces a new H2OFrame of the output of the applied function. The output is stored in H2O so that it can be used in subsequent H2O processes.

See Also

apply for the base generic
Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
summary(apply(iris_hf, 2, sum))
## End(Not run)
```

Description

Convert an H2OFrame to a String

Usage

```r
## S3 method for class 'H2OFrame'
as.character(x, ...)
```

Arguments

- `x` An H2OFrame object
- `...` Further arguments to be passed from or to other methods.

Examples

```r
## Not run:
h2o.init()
pretrained <- as.h2o(data.frame(
  C1 = c("a", "b"), C2 = c(0, 1), C3 = c(1, 0), C4 = c(0.2, 0.8),
  stringsAsFactors = FALSE))
pretrained_w2v <- h2o.word2vec(pre_trained = pretrained, vec_size = 3)
words <- as.character(as.h2o(c("b", "a", "c", NA, "a")))
vecs <- h2o.transform(pretrained_w2v, words = words)
## End(Not run)
```

Description

Converts parsed H2O data into an R data frame

Usage

```r
## S3 method for class 'H2OFrame'
as.data.frame(x, ...)
```
Arguments

\( x \)

An H2OFrame object.

... Further arguments to be passed down from other methods.

Details

Method \texttt{as.data.frame.H2OFrame} will use \texttt{fread} if \texttt{data.table} package is installed in required version.

See Also

\texttt{use.package}

Examples

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
as.data.frame(prostate)

## End(Not run)
```

---

\textbf{as.factor} \hspace{3cm} \textit{Convert H2O Data to Factors}

Description

Convert a column into a factor column.

Usage

\[ \texttt{as.factor}(x) \]

Arguments

\( x \)

a column from an H2OFrame data set.

See Also

\texttt{as.factor}.

Examples

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
summary(prostate)

## End(Not run)
```
as.h2o

Create H2OFrame

Description
Import R object to the H2O cluster.

Usage

as.h2o(x, destination_frame = "", ...)

## Default S3 method:
as.h2o(x, destination_frame = "", ...)

## S3 method for class 'H2OFrame'
as.h2o(x, destination_frame = "", ...)

## S3 method for class 'data.frame'
as.h2o(x, destination_frame = "", ...)

## S3 method for class 'Matrix'
as.h2o(x, destination_frame = "", ...)

Arguments

x
An R object.

destination_frame
A string with the desired name for the H2OFrame.

... arguments passed to method arguments.

Details
Method as.h2o.data.frame will use fwrite if data.table package is installed in required version.
To speedup execution time for large sparse matrices, use h2o datatable. Make sure you have installed and imported data.table and slam packages. Turn on h2o datatable by options("h2o.use.data.table"=TRUE)

See Also

use.package

Examples

## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
euro_hf <- as.h2o(euro)
letters_hf <- as.h2o(letters)
state_hf <- as.h2o(state.x77)
as.matrix.H2OFrame

Convert an H2OFrame to a matrix

Description

Convert an H2OFrame to a matrix

Usage

## S3 method for class 'H2OFrame'
as.matrix(x, ...)

Arguments

x  
An H2OFrame object

...  
Further arguments to be passed down from other methods.

Examples

## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
describe <- h2o.describe(iris_hf)
mins = as.matrix(apply(iris_hf, 2, min))
print(mins)

## End(Not run)
as.numeric

Convert H2O Data to Numeric

Description

Converts an H2O column into a numeric value column.

Usage

as.numeric(x)

Arguments

x  a column from an H2OFrame data set.
...
Further arguments to be passed from or to other methods.

Examples

## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor (prostate[, 2])
prostate[, 2] <- as.numeric(prostate[, 2])
## End(Not run)

as.vector.H2OFrame

Convert an H2OFrame to a vector

Description

Convert an H2OFrame to a vector

Usage

## S3 method for class 'H2OFrame'
as.vector(x,mode)

Arguments

x  An H2OFrame object
mode  Mode to coerce vector to
Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
cor_R <- cor(as.matrix(iris[, 1]))
cor_h2o <- cor(iris_hf[, 1])
iris_R_cor <- cor(iris[, 1:4])
iris_H2O_cor <- as.data.frame(cor(iris_hf[, 1:4]))
h2o_vec <- as.vector(unlist(iris_H2O_cor))
r_vec <- as.vector(unlist(iris_R_cor))
## End(Not run)
```

australia  

Australia Coastal Data

Description

Temperature, soil moisture, runoff, and other environmental measurements from the Australia coast. The data is available from [http://cs.colby.edu/courses/S11/cs251/labs/lab07/AustraliaSubset.csv](http://cs.colby.edu/courses/S11/cs251/labs/lab07/AustraliaSubset.csv).

Format

A data frame with 251 rows and 8 columns

colnames  

Returns the column names of an H2OFrame

Description

Returns the column names of an H2OFrame

Usage

```r
colnames(x, do.NA = TRUE, prefix = "col")
```

Arguments

- `x`: An H2OFrame object.
- `do.NA`: logical. If FALSE and names are NULL, names are created.
- `prefix`: for created names.

Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
colnames(iris_hf) # Returns "Sepal.Length" "Sepal.Width" "Petal.Length" "Petal.Width" "Species"
## End(Not run)
```
dim.H2OFrame

Returns the Dimensions of an H2OFrame

Description

Returns the number of rows and columns for an H2OFrame object.

Usage

```r
## S3 method for class 'H2OFrame'
dim(x)
```

Arguments

- `x`: An H2OFrame object.

See Also

`dim` for the base R method.

Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
dim(iris_hf)
## End(Not run)
```

dimnames.H2OFrame

Column names of an H2OFrame

Description

Set column names of an H2O Frame

Usage

```r
## S3 method for class 'H2OFrame'
dimnames(x)
```

Arguments

- `x`: An H2OFrame
Examples

```r
## Not run:
h2o.init()
n <- 2000
# Generate variables V1, ... V10
X <- matrix(rnorm(10 * n), n, 10)
# y = +1 if sum_i x_{ij}^2 > chisq median on 10 df
y <- rep(-1, n)
y[apply(X*X, 1, sum) > qchisq(.5, 10)] <- 1
# Assign names to the columns of X:
dimnames(X)[[2]] <- c("V1", "V2", "V3", "V4", "V5", "V6", "V7", "V8", "V9", "V10")
## End(Not run)
```

---

**feature_frequencies.H2OModel**

*Retrieve the number of occurrences of each feature for given observations. Available for GBM, Random Forest and Isolation Forest models.*

**Description**

Retrieve the number of occurrences of each feature for given observations. Available for GBM, Random Forest and Isolation Forest models.

**Usage**

```r
feature_frequencies.H2OModel(object, newdata, ...)
h2o.feature_frequencies(object, newdata, ...)
```

**Arguments**

- `object` a fitted `H2OModel` object for which prediction is desired
- `newdata` An H2OFrame object in which to look for variables with which to predict.
- `...` additional arguments to pass on.

**Value**

Returns an H2OFrame contain per-feature frequencies on the predict path for each input row.

**See Also**

`h2o.gbm` and `h2o.randomForest` for model generation in h2o.
**generate_col_ind**

Check to see if the column names/indices entered is valid for the dataframe given. This is an internal function.

**Usage**

`generate_col_ind(data, by)`

**Arguments**

- **data**
  The H2OFrame whose column names or indices are entered as a list.

- **by**
  The column names/indices in a list.

**get_seed.H2OModel**

Get the seed from H2OModel which was used during training. If a user does not set the seed parameter before training, the seed is autogenerated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the seed in R is a string.

**Description**

Get the seed from H2OModel which was used during training. If a user does not set the seed parameter before training, the seed is autogenerated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the seed in R is a string.

**Usage**

`get_seed.H2OModel(object)`

`h2o.get_seed(object)`

**Arguments**

- **object**
  a fitted H2OModel object.

**Value**

Returns seed to be used during training a model. Could be numeric or string.
h2o.abs

Compute the absolute value of x

Description

Compute the absolute value of x

Usage

h2o.abs(x)

Arguments

x An H2OFrame object.

See Also

abs for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
seed <- h2o.get_seed(prostate_gbm)

## End(Not run)

h2o.abs

Examples

## Not run:
library(h2o)
h2o.init()
smtrees_hf <- h2o.importFile(url)
model <- h2o.gbm(x = c("girth", "height"), y = "vol", ntrees = 3, max_depth = 1,
distribution = "gaussian", min_rows = 2, learn_rate = .1,
training_frame = smtrees_hf)
pred <- as.data.frame(predict(model, newdata = smtrees_hf))
diff <- pred - smtrees_df[, 4]
diff.abs <- abs(diff)
print(diff.abs)

## End(Not run)
**h2o.acos**

Compute the arc cosine of x

**Description**

Compute the arc cosine of x

**Usage**

```r
h2o.acos(x)
```

**Arguments**

- `x` An H2OFrame object.

**See Also**

- `acos` for the base R implementation.

**Examples**

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.acos(prostate[,2])
## End(Not run)
```

---

**h2o.aggregated_frame**

Retrieve an aggregated frame from an Aggregator model

**Description**

Retrieve an aggregated frame from the Aggregator model and use it to create a new frame.

**Usage**

```r
h2o.aggregated_frame(model)
```

**Arguments**

- `model` an H2OClusteringModel corresponding from a h2o.aggregator call.
### Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows=100, cols=5, categorical_fraction=0.6, integer_fraction=0,
                      binary_fraction=0, real_range=100, integer_range=100, missing_fraction=0)
target_num_exemplars=1000
rel_tol_num_exemplars=0.5
encoding="Eigen"
agg <- h2o.aggregator(training_frame=df,
                       target_num_exemplars=target_num_exemplars,
                       rel_tol_num_exemplars=rel_tol_num_exemplars,
                       categorical_encoding=encoding)
# Use the aggregated frame to create a new dataframe
new_df <- h2o.aggregated_frame(agg)

## End(Not run)
```

---

**h2o.aggregator**  
**Build an Aggregated Frame**

**Description**

Builds an Aggregated Frame of an H2OFrame.

**Usage**

```r
h2o.aggregator(training_frame, x, model_id = NULL,
                 ignore_const_cols = TRUE, target_num_exemplars = 5000,
                 rel_tol_num_exemplars = 0.5, transform = c("NONE", "STANDARDIZE",
                 "NORMALIZE", "DEMEAN", "DESCALE"), categorical_encoding = c("AUTO",
                 "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen",
                 "LabelEncoder", "SortByResponse", "EnumLimited"),
                 save_mapping_frame = FALSE, num_iteration_without_new_exemplar = 500,
                 export_checkpoints_dir = NULL)
```

**Arguments**

- **training_frame**: Id of the training data frame.
- **x**: A vector containing the character names of the predictors in the model.
- **model_id**: Destination id for this model; auto-generated if not specified.
- **ignore_const_cols**: Logical. Ignore constant columns. Defaults to TRUE.
- **target_num_exemplars**: Targeted number of exemplars. Defaults to 5000.
- **rel_tol_num_exemplars**: Relative tolerance for number of exemplars (e.g. 0.5 is +/- 50 percents) Defaults to 0.5.
- **transform**: Transformation of training data. Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NORMALIZE.
categorical_encoding

Encoding scheme for categorical features. Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

save_mapping_frame

Logical. Whether to export the mapping of the aggregated frame. Defaults to FALSE.

num_iteration_without_new_exemplar

The number of iterations to run before the aggregator exits if the number of exemplars collected didn’t change. Defaults to 500.

export_checkpoints_dir

Automatically export generated models to this directory.

Examples

```r
## Not run:
library(h2o)
h2o.init()

df <- h2o.createFrame(rows=100, cols=5, categorical_fraction=0.6, integer_fraction=0,
                     binary_fraction=0, real_range=100, integer_range=100, missing_fraction=0)
target_num_exemplars=1000
rel_tol_num_exemplars=0.5
encoding="Eigen"

agg <- h2o.aggregator(training_frame=df,
                      target_num_exemplars=target_num_exemplars,
                      rel_tol_num_exemplars=rel_tol_num_exemplars,
                      categorical_encoding=encoding)

## End(Not run)
```

---

**h2o.aic**

Retrieve the Akaike information criterion (AIC) value

**Description**

Retrieves the AIC value. If "train", "valid", and "xval" parameters are FALSE (default), then the training AIC value is returned. If more than one parameter is set to TRUE, then a named vector of AICs are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.aic(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**: An `H2OModel` or `H2OModelMetrics`.
- **train**: Retrieve the training AIC.
- **valid**: Retrieve the validation AIC.
- **xval**: Retrieve the cross-validation AIC.
### h2o.anomaly

Anomaly Detection via H2O Deep Learning Model

**Description**

Detect anomalies in an H2O dataset using an H2O deep learning model with auto-encoding.

**Usage**

```r
h2o.anomaly(object, data, per_feature = FALSE)
```

**Arguments**

- **object**
  - An `H2OAutoEncoderModel` object that represents the model to be used for anomaly detection.

- **data**
  - An H2OFrame object.

- **per_feature**
  - Whether to return the per-feature squared reconstruction error.
h2o.any

Value

Returns an H2OFrame object containing the reconstruction MSE or the per-feature squared error.

See Also

h2o.deeplearning for making an H2OAutoEncoderModel.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
prostate_dl = h2o.deeplearning(x = 3:9, training_frame = prostate, autoencoder = TRUE,
                             hidden = c(10, 10), epochs = 5)
prostate_anon = h2o.anomaly(prostate_dl, prostate)
head(prostate_anon)
head(prostate_anon_per_feature)
## End(Not run)
```

h2o.any

Given a set of logical vectors, is at least one of the values true?

Description

Given a set of logical vectors, is at least one of the values true?

Usage

h2o.any(x)

Arguments

x An H2OFrame object.

See Also

all for the base R implementation.
h2o.anyFactor

Check H2OFrame columns for factors

Description
Determine if any column of an H2OFrame object contains categorical data.

Usage
h2o.anyFactor(x)

Arguments
x
An H2OFrame object.

Value
Returns a logical value indicating whether any of the columns in x are factors.

Examples
```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.anyFactor(iris_hf)
## End(Not run)
```

h2o.arrange

Sorts an H2O frame by columns

Description
Sorts H2OFrame by the columns specified. H2OFrame can contain String columns but should not
sort on any String columns. Otherwise, an error will be thrown. To sort column c1 in descending
order, do desc(c1). Returns a new H2OFrame, like dplyr::arrange.

Usage
h2o.arrange(x, ...)

Arguments
x
The H2OFrame input to be sorted.
...
The column names to sort by.
h2o.ascharacter

Convert H2O Data to Characters

Description

Convert H2O Data to Characters

Usage

h2o.ascharacter(x)

Arguments

x  An H2OFrame object.

See Also

as.character for the base R implementation.

---

h2o.asfactor

Convert H2O Data to Factors

Description

Convert H2O Data to Factors

Usage

h2o.asfactor(x)

Arguments

x  An H2OFrame object.

See Also

as.factor for the base R implementation.
### h2o.asnumeric

**Convert H2O Data to Numerics**

#### Description

Convert H2O Data to Numerics

#### Usage

```r
h2o.asnumeric(x)
```

#### Arguments

- `x` 
  - An H2OFrame object.

#### See Also

- `as.numeric` for the base R implementation.

### h2o.assign

**Rename an H2O object.**

#### Description

Makes a copy of the data frame and gives it the desired key.

#### Usage

```r
h2o.assign(data, key)
```

#### Arguments

- `data` 
  - An H2OFrame object
- `key` 
  - The key to be associated with the H2O parsed data object
**h2o.as_date**

*Convert between character representations and objects of Date class*

**Description**

Functions to convert between character representations and objects of class "Date" representing calendar dates.

**Usage**

```r
h2o.as_date(x, format, ...)
```

**Arguments**

- `x` H2OFrame column of strings or factors to be converted
- `format` A character string indicating date pattern
- `...` Further arguments to be passed from or to other methods.

**h2o.auc**

*Retrieve the AUC*

**Description**

Retrieves the AUC value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUC value is returned. If more than one parameter is set to TRUE, then a named vector of AUCs are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.auc(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- `object` An H2OBinomialMetrics object.
- `train` Retrieve the training AUC
- `valid` Retrieve the validation AUC
- `xval` Retrieve the cross-validation AUC

**See Also**

- `h2o.giniCoef` for the Gini coefficient, `h2o.mse` for MSE, and `h2o.metric` for the various threshold metrics. See `h2o.performance` for creating H2OModelMetrics objects.
## h2o.automl

### Description

The Automatic Machine Learning (AutoML) function automates the supervised machine learning model training process. The current version of AutoML trains and cross-validates a Random Forest, an Extremely-Randomized Forest, a random grid of Gradient Boosting Machines (GBMs), a random grid of Deep Neural Nets, and then trains a Stacked Ensemble using all of the models.

### Usage

```r
h2o.automl(x, y, training_frame, validation_frame = NULL, 
leaderboard_frame = NULL, blending_frame = NULL, nfolds = 5, 
fold_column = NULL, weights_column = NULL, balance_classes = FALSE, 
class_sampling_factors = NULL, max_after_balance_size = 5, 
max_runtime_secs = 3600, max_runtime_secs_per_model = NULL, 
max_models = NULL, stopping_metric = c("AUTO", "deviance", "logloss", 
"MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", 
"misclassification", "mean_per_class_error"), 
stopping_tolerance = NULL, stopping_rounds = 3, seed = NULL, 
project_name = NULL, exclude_algos = NULL, include_algos = NULL, 
keep_cross_validation_predictions = FALSE, 
keep_cross_validation_models = FALSE, 
keep_cross_validation_fold_assignment = FALSE, 
sort_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", 
"RMSLE", "AUC", "mean_per_class_error"), export_checkpoints_dir = NULL, 
verbosity = NULL)
```

### Arguments

- `x`: A vector containing the names or indices of the predictor variables to use in building the model. If `x` is missing, then all columns except `y` are used.

- `y`: The name or index of the response variable in the model. For classification, the `y` column must be a factor, otherwise regression will be performed. Indexes are 1-based in R.

---

### Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.auc(perf)

## End(Not run)
```
h2o.automl

training frame  Training frame (H2OFrame or ID).

validation frame  Validation frame (H2OFrame or ID); Optional. This argument is ignored unless the user sets nfolds = 0. If cross-validation is turned off, then a validation frame can be specified and used for early stopping of individual models and early stopping of the grid searches. By default and when nfolds > 1, cross-validation metrics will be used for early stopping and thus validation_frame will be ignored.

leaderboard frame  Leaderboard frame (H2OFrame or ID); Optional. If provided, the Leaderboard will be scored using this data frame instead of using cross-validation metrics, which is the default.

blending frame  Blending frame (H2OFrame or ID) used to train the metalearning algorithm in Stacked Ensembles (instead of relying on cross-validated predicted values); Optional.

nfolds  Number of folds for k-fold cross-validation. Defaults to 5. Use 0 to disable cross-validation; this will also disable Stacked Ensemble (thus decreasing the overall model performance).

fold_column  Column with cross-validation fold index assignment per observation; used to override the default, randomized, 5-fold cross-validation scheme for individual models in the AutoML run.

weights_column  Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed.

balance_classes  Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors  Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size  Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_runtime_secs  Maximum allowed runtime in seconds for the entire model training process. Use 0 to disable. Defaults to 3600 secs (1 hour).

max_runtime_secs_per_model  Maximum runtime in seconds dedicated to each individual model training process. Use 0 to disable. Defaults to 0.

max_models  Maximum number of models to build in the AutoML process (does not include Stacked Ensembles). Defaults to NULL.

stopping_metric  Metric to use for early stopping ("AUTO" is logloss for classification, deviance for regression). Must be one of "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "mean_per_class_error". Defaults to AUTO.
stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much). This value defaults to 0.001 if the dataset is at least 1 million rows; otherwise it defaults to a bigger value determined by the size of the dataset and the non-NA-rate. In that case, the value is computed as \( \frac{1}{\sqrt{\text{nrows} \times \text{non-NA-rate}}} \).

stopping_rounds
Integer. Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k (stopping_rounds) scoring events. Defaults to 3 and must be an non-zero integer. Use 0 to disable early stopping.

seed
Integer. Set a seed for reproducibility. AutoML can only guarantee reproducibility if max_models or early stopping is used because max_runtime_secs is resource limited, meaning that if the resources are not the same between runs, AutoML may be able to train more models on one run vs another.

project_name
Character string to identify an AutoML project. Defaults to NULL, which means a project name will be auto-generated based on the training frame ID.

exclude_algos
Vector of character strings naming the algorithms to skip during the model-building phase. An example use is exclude_algos = c("GLM", "DeepLearning", "DRF"), and the full list of options is: "DRF" (Random Forest and Extremely-Randomized Trees), "GLM", "XGBoost", "GBM", "DeepLearning" and "StackedEnsemble".

include_algos
Vector of character strings naming the algorithms to restrict to during the model-building phase. This can’t be used in combination with exclude_algos param.

keep_cross_validation_predictions
Logical. Whether to keep the predictions of the cross-validation predictions. This needs to be set to TRUE if running the same AutoML object for repeated runs because CV predictions are required to build additional Stacked Ensemble models in AutoML. This option defaults to FALSE.

keep_cross_validation_models
Logical. Whether to keep the cross-validated models. Keeping cross-validation models may consume significantly more memory in the H2O cluster. This option defaults to FALSE.

keep_cross_validation_fold_assignment
Logical. Whether to keep fold assignments in the models. Deleting them will save memory in the H2O cluster. Defaults to FALSE.

sort_metric
Metric to sort the leaderboard by. For binomial classification choose between "AUC", "logloss", "mean_per_class_error", "RMSE", "MSE". For regression choose between "mean_residual_deviance", "RMSE", "MSE", "MAE", and "RM-SLE". For multinomial classification choose between "mean_per_class_error", "logloss", "RMSE", "MSE". Default is "AUTO". If set to "AUTO", then "AUC" will be used for binomial classification, "mean_per_class_error" for multinomial classification, and "mean_residual_deviance" for regression.

export_checkpoints_dir
(Optional) Path to a directory where every model will be stored in binary form.

verbosity
Verbosity of the backend messages printed during training; Optional. Must be one of "debug", "info", "warn". Defaults to NULL (disable live log).
**Details**

AutoML finds the best model, given a training frame and response, and returns an H2OAutoML object, which contains a leaderboard of all the models that were trained in the process, ranked by a default model performance metric.

**Value**

An H2OAutoML object.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
votes_hf <- h2o.uploadFile(path = votes_path, header = TRUE)
aml <- h2o.automl(y = "Class", training_frame = votes_hf, max_runtime_secs = 30)
## End(Not run)
```

---

**h2o.betweenss**

Get the between cluster sum of squares

**Description**

Get the between cluster sum of squares. If "train", "valid", and "xval" parameters are FALSE (default), then the training betweenss value is returned. If more than one parameter is set to TRUE, then a named vector of betweenss' are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.betweenss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**: An H2OClusteringModel object.
- **train**: Retrieve the training between cluster sum of squares
- **valid**: Retrieve the validation between cluster sum of squares
- **xval**: Retrieve the cross-validation between cluster sum of squares
**h2o.biases**

*Return the respective bias vector*

**Description**

Return the respective bias vector

**Usage**

```r
h2o.biases(object, vector_id = 1)
```

**Arguments**

- **object**
  An `H2OModel` or `H2OModelMetrics`

- **vector_id**
  An integer, ranging from 1 to number of layers + 1, that specifies the bias vector to return.

---

**h2o.bottomN**

*H2O bottomN*

**Description**

bottomN function will grab the bottom N percent of values of a column and return it in a H2OFrame. Extract the top N percent of values of a column and return it in a H2OFrame.

**Usage**

```r
h2o.bottomN(x, column, nPercent)
```

**Arguments**

- **x**
  an H2OFrame

- **column**
  is a column name or column index to grab the top N percent value from

- **nPercent**
  is a bottom percentage value to grab

**Value**

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the bottomN values
h2o.cbind

**Combine H2O Datasets by Columns**

**Description**
Takes a sequence of H2O data sets and combines them by column

**Usage**

```
h2o.cbind(...)```

**Arguments**

```
...  
```
A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number of rows.

**Value**
An H2OFrame object containing the combined ...arguments column-wise.

**See Also**

`cbind` for the base R method.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_cbind <- h2o.cbind(prostate, prostate)
head(prostate_cbind)
## End(Not run)
```

---

h2o.ceil

**Take a single numeric argument and return a numeric vector with the smallest integers**

**Description**

`ceiling` takes a single numeric argument `x` and returns a numeric vector containing the smallest integers not less than the corresponding elements of `x`.

**Usage**

```
h2o.ceil(x)```

**Arguments**

```
x  
```
An H2OFrame object.
**h2o.centroid_stats**

See Also

`ceiling` for the base R implementation.

---

### h2o.centers

**Retrieve the Model Centers**

**Description**

Retrieve the Model Centers

**Usage**

```r
h2o.centers(object)
```

**Arguments**

- `object` An `H2OClusteringModel` object.

---

### h2o.centersSTD

**Retrieve the Model Centers STD**

**Description**

Retrieve the Model Centers STD

**Usage**

```r
h2o.centersSTD(object)
```

**Arguments**

- `object` An `H2OClusteringModel` object.

---

### h2o.centroid_stats

**Retrieve centroid statistics**

**Description**

Retrieve the centroid statistics. If "train", "valid", and "xval" parameters are FALSE (default), then the training centroid stats value is returned. If more than one parameter is set to TRUE, then a named list of centroid stats data frames are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.centroid_stats(object, train = FALSE, valid = FALSE, xval = FALSE)
```
**h2o.clearLog**

### Arguments

- **object**: An `H2OClusteringModel` object.
- **train**: Retrieve the training centroid statistics.
- **valid**: Retrieve the validation centroid statistics.
- **xval**: Retrieve the cross-validation centroid statistics.

### Description

Clear all H2O R command and error response logs from the local disk. Used primarily for debugging purposes.

### Usage

```r
h2o.clearLog()
```

### See Also

- `h2o.startLogging`, `h2o.stopLogging`, `h2o.openLog`

### Examples

```r
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
h2o.clearLog()

## End(Not run)
```

---

**h2o.clusterInfo**

### Description

Print H2O cluster info.

### Usage

```r
h2o.clusterInfo()
```
h2o.clusterIsUp

*Determine if an H2O cluster is up or not*

**Description**

Determine if an H2O cluster is up or not

**Usage**

```
h2o.clusterIsUp(conn = h2o.getConnection())
```

**Arguments**

- `conn` : H2OConnection object

**Value**

TRUE if the cluster is up; FALSE otherwise

---

h2o.clusterStatus

*Return the status of the cluster*

**Description**

Retrieve information on the status of the cluster running H2O.

**Usage**

```
h2o.clusterStatus()
```

**See Also**

H2OConnection, h2o.init

**Examples**

```
## Not run:
h2o.init()
h2o.clusterStatus()

## End(Not run)
```
h2o.cluster_sizes

Retrieve the cluster sizes

Description

Retrieve the cluster sizes. If "train", "valid", and "xval" parameters are FALSE (default), then the training cluster sizes value is returned. If more than one parameter is set to TRUE, then a named list of cluster size vectors are returned, where the names are "train", "valid" or "xval".

Usage

h2o.cluster_sizes(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

- object: An H2OClusteringModel object.
- train: Retrieve the training cluster sizes
- valid: Retrieve the validation cluster sizes
- xval: Retrieve the cross-validation cluster sizes

h2o.coef

Return the coefficients that can be applied to the non-standardized data.

Description

Note: standardize = True by default. If set to False, then coef() returns the coefficients that are fit directly.

Usage

h2o.coef(object)

Arguments

- object: an H2OModel object.
h2o.coef_norm

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

Description

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

Usage

h2o.coef_norm(object)

Arguments

object an H2OModel object.

h2o.colnames

Return column names of an H2OFrame

Description

Return column names of an H2OFrame

Usage

h2o.colnames(x)

Arguments

x An H2OFrame object.

See Also

colnames for the base R implementation.
h2o.columns_by_type

Obtain a list of columns that are specified by 'coltype'

Description
Obtain a list of columns that are specified by 'coltype'

Usage
h2o.columns_by_type(object, coltype = "numeric", ...)

Arguments

object
H2OFrame object

coltype
A character string indicating which column type to filter by. This must be one of the following: "numeric" - Numeric, but not categorical or time "categorical" - Integer, with a categorical/factor String mapping "string" - String column "time" - Long msec since the Unix Epoch - with a variety of display/parse options "uuid" - UUID "bad" - No none-NA rows (triple negative! all NAs or zero rows)

...
Ignored

Value
A list of column indices that correspond to "type"

Examples

## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.columns_by_type(prostate, coltype="numeric")

## End(Not run)

h2o.computeGram
Compute weighted gram matrix.

Description
Compute weighted gram matrix.

Usage
h2o.computeGram(X, weights = "", use_all_factor_levels = FALSE,
standardize = TRUE, skip_missing = FALSE)
**h2o.confusionMatrix**

**Arguments**

- `X`: an `H2OModel` corresponding to H2O frame.
- `weights`: character corresponding to name of weight vector in frame.
- `use_all_factor_levels`: logical flag telling h2o whether or not to skip first level of categorical variables during one-hot encoding.
- `standardize`: logical flag telling h2o whether or not to standardize data.
- `skip_missing`: logical flag telling h2o whether skip rows with missing data or impute them with mean.

**Description**

Retrieve either a single or many confusion matrices from H2O objects.

**Usage**

```r
h2o.confusionMatrix(object, ...)  
## S4 method for signature 'H2OModel'
h2o.confusionMatrix(object, newdata, valid = FALSE, ...)
## S4 method for signature 'H2OModelMetrics'
h2o.confusionMatrix(object,  
  thresholds = NULL, metrics = NULL)
```

**Arguments**

- `object`: Either an `H2OModel` object or an `H2OModelMetrics` object.
- `...`: Extra arguments for extracting train or valid confusion matrices.
- `newdata`: An H2OFrame object that can be scored on. Requires a valid response column.
- `valid`: Retrieve the validation metric.
- `thresholds`: (Optional) A value or a list of valid values between 0.0 and 1.0. This value is only used in the case of `H2OBinomialMetrics` objects.
- `metrics`: (Optional) A metric or a list of valid metrics ("min_per_class_accuracy", "absolute_mcc", "tnr", "fnr", "fpr", "tpr", "precision", "accuracy", "f0point5", "f2", "f1"). This value is only used in the case of `H2OBinomialMetrics` objects.

**Details**

The `H2OModelMetrics` version of this function will only take `H2OBinomialMetrics` or `H2OMultinomialMetrics` objects. If no threshold is specified, all possible thresholds are selected.
Value
Calling this function on H2OModel objects returns a confusion matrix corresponding to the predict function. If used on an H2OBinomialMetrics object, returns a list of matrices corresponding to the number of thresholds specified.

See Also
predict for generating prediction frames, h2o.performance for creating H2OModelMetrics.

Examples
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.confusionMatrix(model, prostate)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.confusionMatrix(perf)
## End(Not run)

h2o.connect

Connect to a running H2O instance.

Description
Connect to a running H2O instance.

Usage
h2o.connect(ip = "localhost", port = 54321, strict_version_check = TRUE, proxy = NA_character_, https = FALSE, cacert = NA_character_, insecure = FALSE, username = NA_character_, password = NA_character_, use_spnego = FALSE, cookies = NA_character_, context_path = NA_character_, config = NULL)

Arguments
ip Object of class character representing the IP address of the server where H2O is running.
port Object of class numeric representing the port number of the H2O server.
strict_version_check (Optional) Setting this to FALSE is unsupported and should only be done when advised by technical support.
proxy (Optional) A character string specifying the proxy path.
https (Optional) Set this to TRUE to use https instead of http.
h2o.cor

Correlation of columns.

Description

Compute the correlation matrix of one or two H2O_frames.

Usage

h2o.cor(x, y = NULL, na.rm = FALSE, use)

cor(x, ...)

Arguments

x  An H2OFrame object.

y  NULL (default) or an H2OFrame. The default is equivalent to y = x.

na.rm  logical. Should missing values be removed?
`h2o.cos`  Compute the cosine of x

**Description**  
Compute the cosine of x

**Usage**  
`h2o.cos(x)`

**Arguments**  

`x`  An H2OFrame object.

**See Also**  
`cos` for the base R implementation.

---

`h2o.cosh`  Compute the hyperbolic cosine of x

**Description**  
Compute the hyperbolic cosine of x

**Usage**  
`h2o.cosh(x)`

**Arguments**  

`x`  An H2OFrame object.
See Also
cosh for the base R implementation.

h2o.coxph
Trains a Cox Proportional Hazards Model (CoxPH) on an H2O dataset

Description
Trains a Cox Proportional Hazards Model (CoxPH) on an H2O dataset

Usage
h2o.coxph(x, event_column, training_frame, model_id = NULL,
start_column = NULL, stop_column = NULL, weights_column = NULL,
offset_column = NULL, stratify_by = NULL, ties = c("efron",
"breslow"), init = 0, lre_min = 9, max_iterations = 20,
interactions = NULL, interaction_pairs = NULL,
interactions_only = NULL, use_all_factor_levels = FALSE,
export_checkpoints_dir = NULL)

Arguments
x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except event_column, start_column and stop_column are used.

event_column The name of binary data column in the training frame indicating the occurrence of an event.

training_frame Id of the training data frame.

model_id Destination id for this model; auto-generated if not specified.

start_column Start Time Column.

stop_column Stop Time Column.

weights_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset_column Offset column. This will be added to the combination of columns before applying the link function.

stratify_by List of columns to use for stratification.

ties Method for Handling Ties. Must be one of: "efron", "breslow". Defaults to efron.

init Coefficient starting value. Defaults to 0.

lre_min Minimum log-relative error. Defaults to 9.

max_iterations Maximum number of iterations. Defaults to 20.
interactions  A list of predictor column indices to interact. All pairwise combinations will be computed for the list.

interaction_pairs  A list of pairwise (first order) column interactions.

interactions_only  A list of columns that should only be used to create interactions but should not itself participate in model training.

use_all_factor_levels  Logical. (Internal. For development only!) Indicates whether to use all factor levels. Defaults to FALSE.

export_checkpoints_dir  Automatically export generated models to this directory.

h2o.createFrame  Data H2OFrame Creation in H2O

Description

Creates a data frame in H2O with real-valued, categorical, integer, and binary columns specified by the user.

Usage

h2o.createFrame(rows = 10000, cols = 10, randomize = TRUE, value = 0, real_range = 100, categorical_fraction = 0.2, factors = 100, integer_fraction = 0.2, integer_range = 100, binary_fraction = 0.1, binary_ones_fraction = 0.02, time_fraction = 0, string_fraction = 0, missing_fraction = 0.01, response_factors = 2, has_response = FALSE, seed, seed_for_column_types)

Arguments

rows  The number of rows of data to generate.

cols  The number of columns of data to generate. Excludes the response column if has_response = TRUE.

randomize  A logical value indicating whether data values should be randomly generated. This must be TRUE if either categorical_fraction or integer_fraction is non-zero.

value  If randomize = FALSE, then all real-valued entries will be set to this value.

real_range  The range of randomly generated real values.

categorical_fraction  The fraction of total columns that are categorical.

factors  The number of (unique) factor levels in each categorical column.

integer_fraction  The fraction of total columns that are integer-valued.

integer_range  The range of randomly generated integer values.
h2o.cross_validation_fold_assignment

Retrieve the cross-validation fold assignment

Description

Retrieve the cross-validation fold assignment

Usage

h2o.cross_validation_fold_assignment(object)
Arguments

object An H2OModel object.

Value

Returns a H2OFrame

---

Description

Retrieve the cross-validation holdout predictions

Usage

h2o.cross_validation_holdout_predictions(object)

Arguments

object An H2OModel object.

Value

Returns a H2OFrame

---

Description

Retrieve the cross-validation models

Usage

h2o.cross_validation_models(object)

Arguments

object An H2OModel object.

Value

Returns a list of H2OModel objects
h2o.cross_validation_predictions

*Retrieve the cross-validation predictions*

**Description**

Retrieve the cross-validation predictions

**Usage**

```r
h2o.cross_validation_predictions(object)
```

**Arguments**

- `object`: An H2OModel object.

**Value**

Returns a list of H2OFrame objects

---

h2o.cummax

*Return the cumulative max over a column or across a row*

**Description**

Return the cumulative max over a column or across a row

**Usage**

```r
h2o.cummax(x, axis = 0)
```

**Arguments**

- `x`: An H2OFrame object.
- `axis`: An int that indicates whether to do down a column (0) or across a row (1).

**See Also**

`cummax` for the base R implementation.
**h2o.cummin**

*Return the cumulative min over a column or across a row*

**Description**

Return the cumulative min over a column or across a row

**Usage**

```
h2o.cummin(x, axis = 0)
```

**Arguments**

- `x`: An H2OFrame object.
- `axis`: An int that indicates whether to do down a column (0) or across a row (1).

**See Also**

`cummin` for the base R implementation.

---

**h2o.cumprod**

*Return the cumulative product over a column or across a row*

**Description**

Return the cumulative product over a column or across a row

**Usage**

```
h2o.cumprod(x, axis = 0)
```

**Arguments**

- `x`: An H2OFrame object.
- `axis`: An int that indicates whether to do down a column (0) or across a row (1).

**See Also**

`cumprod` for the base R implementation.
h2o.cumsum

Return the cumulative sum over a column or across a row

Description
Return the cumulative sum over a column or across a row

Usage
h2o.cumsum(x, axis = 0)

Arguments
x
An H2OFrame object.
axis
An int that indicates whether to do down a column (0) or across a row (1).

See Also
cumsum for the base R implementation.

h2o.cut
Cut H2O Numeric Data to Factor

Description
Divides the range of the H2O data into intervals and codes the values according to which interval they fall in. The leftmost interval corresponds to the level one, the next is level two, etc.

Usage
h2o.cut(x, breaks, labels = NULL, include.lowest = FALSE, right = TRUE, dig.lab = 3, ...)

## S3 method for class 'H2OFrame'
cut(x, breaks, labels = NULL, include.lowest = FALSE, right = TRUE, dig.lab = 3, ...)

Arguments
x
An H2OFrame object with a single numeric column.
breaks
A numeric vector of two or more unique cut points.
labels
Labels for the levels of the resulting category. By default, labels are constructed sing "(a,b]" interval notation.
include.lowest
Logical, indicating if an 'x[i]' equal to the lowest (or highest, for right = FALSE 'breaks' value should be included
right
Logical, indicating if the intervals should be closed on the right (opened on the left) or vice versa.
dig.lab
Integer which is used when labels are not given, determines the number of digits used in formatting the break numbers.
...
Further arguments passed to or from other methods.
Value

Returns an H2OFrame object containing the factored data with intervals as levels.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Cut sepal length column into intervals determined by min/max/quantiles
sepal_len_cut <- cut(iris_hf$Sepal.Length, c(4.2, 4.8, 5.8, 6, 8))
head(sepal_len_cut)
summary(sepal_len_cut)

## End(Not run)
```

---

**h2o.day**

*Convert Milliseconds to Day of Month in H2O Datasets*

**Description**

Converts the entries of an H2OFrame object from milliseconds to days of the month (on a 1 to 31 scale).

**Usage**

```r
h2o.day(x)
day(x)
```

```r
## S3 method for class 'H2OFrame'
day(x)
```

**Arguments**

- `x` An H2OFrame object.

**Value**

An H2OFrame object containing the entries of `x` converted to days of the month.

**See Also**

- `h2o.month`
h2o.dayOfWeek

**Convert Milliseconds to Day of Week in H2O Datasets**

**Description**
Converts the entries of an H2OFrame object from milliseconds to days of the week (on a 0 to 6 scale).

**Usage**
```r
h2o.dayOfWeek(x)
dayOfWeek(x)
```

## S3 method for class 'H2OFrame'
```r
dayOfWeek(x)
```

**Arguments**
- `x` An H2OFrame object.

**Value**
An H2OFrame object containing the entries of `x` converted to days of the week.

**See Also**
- `h2o.day`, `h2o.month`

---

h2o.dct

**Compute DCT of an H2OFrame**

**Description**
Compute the Discrete Cosine Transform of every row in the H2OFrame.

**Usage**
```r
h2o.dct(data, destination_frame, dimensions, inverse = FALSE)
```

**Arguments**
- `data` An H2OFrame object representing the dataset to transform
- `destination_frame` A frame ID for the result
- `dimensions` An array containing the 3 integer values for height, width, depth of each sample. The product of HxWxD must total up to less than the number of columns. For 1D, use c(L,1,1), for 2D, use C(N,M,1).
- `inverse` Whether to perform the inverse transform
Value

  Returns an H2OFrame object.

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows = 1000, cols = 8 * 16 * 24,
                      categorical_fraction = 0, integer_fraction = 0, missing_fraction = 0)
df1 <- h2o.dct(data=df, dimensions=c(8 * 16 * 24, 1, 1))
df2 <- h2o.dct(data=df1, dimensions=c(8 * 16 * 24, 1, 1), inverse=TRUE)
max(abs(df1 - df2))

df1 <- h2o.dct(data=df, dimensions=c(8 * 16, 24, 1))
df2 <- h2o.dct(data=df1, dimensions=c(8 * 16, 24, 1), inverse=TRUE)
max(abs(df1 - df2))

df1 <- h2o.dct(data=df, dimensions=c(8, 16, 24))
df2 <- h2o.dct(data=df1, dimensions=c(8, 16, 24), inverse=TRUE)
max(abs(df1 - df2))
## End(Not run)
```

h2o.ddply

**Split H2O Dataset, Apply Function, and Return Results**

Description

For each subset of an H2O data set, apply a user-specified function, then combine the results. This is an experimental feature.

Usage

```r
h2o.ddply(X, .variables, FUN, ..., .progress = "none")
```

Arguments

- **X**: An H2OFrame object to be processed.
- **.variables**: Variables to split X by, either the indices or names of a set of columns.
- **FUN**: Function to apply to each subset grouping.
- **...**: Additional arguments passed on to FUN.
- **.progress**: Name of the progress bar to use. #TODO: (Currently unimplemented)

Value

  Returns an H2OFrame object containing the results from the split/apply operation, arranged

See Also

- [ddply](#) for the plyr library implementation.
h2o.decryptionSetup

Setup a Decryption Tool

Description

If your source file is encrypted - setup a Decryption Tool and then provide the reference (result of this function) to the import functions.

Usage

h2o.decryptionSetup(keystore, keystore_type = "JCEKS", key_alias = NA_character_, password = NA_character_, decrypt_tool = "", decrypt_impl = "water.parser.GenericDecryptionTool", cipher_spec = NA_character_)

Arguments

keystore An H2OFrame object referencing a loaded Java Keystore (see example).
keystore_type (Optional) Specification of Keystore type, defaults to JCEKS.
key_alias Which key from the keystore to use for decryption.
password Password to the keystore and the key.
decrypt_tool (Optional) Name of the decryption tool.
decrypt_impl (Optional) Java class name implementing the Decryption Tool.
cipher_spec Specification of a cipher (eg.: AES/ECB/PKCS5Padding).

See Also

h2o.importFile, h2o.parseSetup
Examples

```r
## Not run:
library(h2o)
h2o.init()

ks_path <- system.file("extdata", "keystore.jks", package = "h2o")
keystore <- h2o.importFile(path = ks_path, parse = FALSE) # don't parse, keep as a binary file
cipher <- "AES/ECB/PKCS5Padding"
pwd <- "Password123"
alias <- "secretKeyAlias"
dt <- h2o.decryptionSetup(keystore, key_alias = alias, password = pwd, cipher_spec = cipher)
data_path <- system.file("extdata", "prostate.csv.aes", package = "h2o")
data <- h2o.importFile(data_path, decrypt_tool = dt)
summary(data)

## End(Not run)
```

---

h2o.deepfeatures | Feature Generation via H2O Deep Learning or DeepWater Model

Description

Extract the non-linear feature from an H2O data set using an H2O deep learning model.

Usage

```r
h2o.deepfeatures(object, data, layer)
```

Arguments

- `object`: An H2OModel object that represents the deep learning model to be used for feature extraction.
- `data`: An H2OFrame object.
- `layer`: Index (for DeepLearning, integer) or Name (for DeepWater, String) of the hidden layer to extract.

Value

Returns an H2OFrame object with as many features as the number of units in the hidden layer of the specified index.

See Also

- `h2o.deeplearning` for making H2O Deep Learning models.
- `h2o.deepwater` for making H2O DeepWater models.
Examples

```r
## Not run:
library(h2o)
   h2o.init()
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
prostate_dl = h2o.deeplearning(x = 3:9, y = 2, training_frame = prostate,
   hidden = c(100, 200), epochs = 5)
prostate_deepfeatures_layer1 = h2o.deepfeatures(prostate_dl, prostate, layer = 1)
prostate_deepfeatures_layer2 = h2o.deepfeatures(prostate_dl, prostate, layer = 2)
head(prostate_deepfeatures_layer1)
head(prostate_deepfeatures_layer2)

#if (h2o.deepwater.available()) {
   prostate_dl = h2o.deepwater(x = 3:9, y = 2, backend="mxnet", training_frame = prostate,
   hidden = c(100, 200), epochs = 5)
   prostate_deepfeatures_layer1 = h2o.deepfeatures(prostate_dl, prostate, layer = "fc1_w")
   prostate_deepfeatures_layer2 = h2o.deepfeatures(prostate_dl, prostate, layer = "fc2_w")
   head(prostate_deepfeatures_layer1)
   head(prostate_deepfeatures_layer2)
#}

## End(Not run)
```

---

### h2o.deeplearning

**Build a Deep Neural Network model using CPUs**

**Description**

Builds a feed-forward multilayer artificial neural network on an H2OFrame.

**Usage**

```r
h2o.deeplearning(x, y, training_frame, model_id = NULL,
validation_frame = NULL, nfolds = 0,

"EnumLimited"), elastic_averaging = FALSE,
estatic_averaging_moving_rate = 0.9,
estatic_averaging_regularization = 0.001,
export_checkpoints_dir = NULL, verbose = FALSE)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-

fication model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to
0.
keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions
Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep_cross_validation_fold_assignment
Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold_assignment
Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column
Column with cross-validation fold index assignment per observation.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

score_each_iteration
Logical. Whether to score during each iteration of model training. Defaults to FALSE.

weights_column
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset_column
Offset column. This will be added to the combination of columns before applying the link function.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_hit_ratio_k
Max. number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable). Defaults to 0.

checkpoint
Model checkpoint to resume training with.

pretrained_autoencoder
Pretrained autoencoder model to initialize this model with.

overwrite_with_best_model
Logical. If enabled, override the final model with the best model found during training. Defaults to TRUE.

use_all_factor_levels
Logical. Use all factor levels of categorical variables. Otherwise, the first factor level is omitted (without loss of accuracy). Useful for variable importances and auto-enabled for autoencoder. Defaults to TRUE.
standardize Logical. If enabled, automatically standardize the data. If disabled, the user must provide properly scaled input data. Defaults to TRUE.

hidden Hidden layer sizes (e.g. [100, 100]). Defaults to c(200, 200).

epochs How many times the dataset should be iterated (streamed), can be fractional. Defaults to 10.

train_samples_per_iteration Number of training samples (globally) per MapReduce iteration. Special values are 0: one epoch, -1: all available data (e.g., replicated training data), -2: automatic. Defaults to -2.

target_ratio_comm_to_comp Target ratio of communication overhead to computation. Only for multi-node operation and train_samples_per_iteration = -2 (auto-tuning). Defaults to 0.05.

seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Note: only reproducible when running single threaded. Defaults to -1 (time-based random number).

adaptive_rate Logical. Adaptive learning rate. Defaults to TRUE.

rho Adaptive learning rate time decay factor (similarity to prior updates). Defaults to 0.99.

epsilon Adaptive learning rate smoothing factor (to avoid divisions by zero and allow progress). Defaults to 1e-08.

rate Learning rate (higher => less stable, lower => slower convergence). Defaults to 0.005.

rate_annealing Learning rate annealing: rate / (1 + rate_annealing * samples). Defaults to 1e-06.

rate_decay Learning rate decay factor between layers (N-th layer: rate * rate_decay ^ (n - 1)). Defaults to 1.

momentum_start Initial momentum at the beginning of training (try 0.5). Defaults to 0.

momentum_ramp Number of training samples for which momentum increases. Defaults to 1000000.

momentum_stable Final momentum after the ramp is over (try 0.99). Defaults to 0.

nesterov_accelerated_gradient Logical. Use Nesterov accelerated gradient (recommended). Defaults to TRUE.

input_dropout_ratio Input layer dropout ratio (can improve generalization, try 0.1 or 0.2). Defaults to 0.

hidden_dropout_ratios Hidden layer dropout ratios (can improve generalization), specify one value per hidden layer, defaults to 0.5.

l1 L1 regularization (can add stability and improve generalization, causes many weights to become 0). Defaults to 0.

l2 L2 regularization (can add stability and improve generalization, causes many weights to be small. Defaults to 0.

max_w2 Constraint for squared sum of incoming weights per unit (e.g. for Rectifier). Defaults to 3.4028235e+38.
initial_weight_distribution

initial_weight_scale
Uniform: -value...value, Normal: stddev. Defaults to 1.

initial_weights
A list of H2OFrame ids to initialize the weight matrices of this model with.

initial_biases
A list of H2OFrame ids to initialize the bias vectors of this model with.

loss

distribution
Distribution function. Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

quantile_alpha
Desired quantile for Quantile regression, must be between 0 and 1. Defaults to 0.5.

tweedie_power
Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

huber_alpha
Desired quantile for Huber/M-regression (threshold between quadratic and linear loss, must be between 0 and 1). Defaults to 0.9.

score_interval
Shortest time interval (in seconds) between model scoring. Defaults to 5.

score_training_samples
Number of training set samples for scoring (0 for all). Defaults to 10000.

score_validation_samples
Number of validation set samples for scoring (0 for all). Defaults to 0.

score_duty_cycle
Maximum duty cycle fraction for scoring (lower: more training, higher: more scoring). Defaults to 0.1.

classification_stop
Stopping criterion for classification error fraction on training data (-1 to disable). Defaults to 0.

regression_stop
Stopping criterion for regression error (MSE) on training data (-1 to disable). Defaults to 1e-06.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 5.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.
score_validation_sampling
Method used to sample validation dataset for scoring. Must be one of: "Uniform", "Stratified". Defaults to Uniform.

diagnostics Logical. Enable diagnostics for hidden layers. Defaults to TRUE.

fast_mode Logical. Enable fast mode (minor approximation in back-propagation). Defaults to TRUE.

force_load_balance Logical. Force extra load balancing to increase training speed for small datasets (to keep all cores busy). Defaults to TRUE.

variable_importances Logical. Compute variable importances for input features (Gedeon method) - can be slow for large networks. Defaults to TRUE.

replicate_training_data Logical. Replicate the entire training dataset onto every node for faster training on small datasets. Defaults to TRUE.

single_node_mode Logical. Run on a single node for fine-tuning of model parameters. Defaults to FALSE.

shuffle_training_data Logical. Enable shuffling of training data (recommended if training data is replicated and train_samples_per_iteration is close to #nodes x #rows, or if using balance_classes). Defaults to FALSE.

missing_values_handling Handling of missing values. Either MeanImputation or Skip. Must be one of: "MeanImputation", "Skip". Defaults to MeanImputation.

quiet_mode Logical. Enable quiet mode for less output to standard output. Defaults to FALSE.

autoencoder Logical. Auto-Encoder. Defaults to FALSE.

sparse Logical. Sparse data handling (more efficient for data with lots of 0 values). Defaults to FALSE.

col_major Logical. #DEPRECATED Use a column major weight matrix for input layer. Can speed up forward propagation, but might slow down backpropagation. Defaults to FALSE.

average_activation Average activation for sparse auto-encoder. #Experimental Defaults to 0.

sparsity_beta Sparsity regularization. #Experimental Defaults to 0.

max_categorical_features Max. number of categorical features, enforced via hashing. #Experimental Defaults to 2147483647.

reproducible Logical. Force reproducibility on small data (will be slow - only uses 1 thread). Defaults to FALSE.

export_weights_and_biases Logical. Whether to export Neural Network weights and biases to H2O Frames. Defaults to FALSE.

mini_batch_size Mini-batch size (smaller leads to better fit, larger can speed up and generalize better). Defaults to 1.

categorical_encoding Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.
elasticsearch

elasticsearch

elastic_averaging
Logical. Elastic averaging between compute nodes can improve distributed model convergence. Defaults to FALSE.

elastic_averaging_moving_rate
Elastic averaging moving rate (only if elastic averaging is enabled). Defaults to 0.9.

elastic_averaging_regularization
Elastic averaging regularization strength (only if elastic averaging is enabled). Defaults to 0.001.

export_checkpoints_dir
Automatically export generated models to this directory.

verbose
Logical. Print scoring history to the console (Metrics per epoch). Defaults to FALSE.

activation = c("Rectifier", "Tanh"), hidden = NULL,
input_dropout_ratio = 0, hidden_dropout_ratios = NULL,
problem_type = c("auto", "image", "dataset"),
extport_checkpoints_dir = NULL)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-
fication model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
checkpoint Model checkpoint to resume training with.
autoencoder Logical. Auto-Encoder. Defaults to FALSE.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to
0.
balance_classes Logical. Balance training data class counts via over/under-sampling (for im-
balanced data). Defaults to FALSE.
max_after_balance_size Maximum relative size of the training data after balancing class counts (can be
less than 1.0). Requires balance_classes. Defaults to 5.0.
class_sampling_factors Desired over/under-sampling ratios per class (in lexicographic order). If not
specified, sampling factors will be automatically computed to obtain class bal-
ance during training. Requires balance_classes.
keep_cross_validation_models
   Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep_cross_validation_predictions
   Logical. Whether to keep the predictions of the cross-validation models. De-
   fault to FALSE.

keep_cross_validation_fold_assignment
   Logical. Whether to keep the cross-validation fold assignment. Defaults to
   FALSE.

fold_assignment
   Cross-validation fold assignment scheme, if fold_column is not specified. The
   'Stratified' option will stratify the folds based on the response variable, for clas-
   sification problems. Must be one of: "AUTO", "Random", "Modulo", "Strati-
   fied". Defaults to AUTO.

fold_column
   Column with cross-validation fold index assignment per observation.

offset_column
   Offset column. This will be added to the combination of columns before apply-
   ing the link function.

weights_column
   Column with observation weights. Giving some observation a weight of zero
   is equivalent to excluding it from the dataset; giving an observation a relative
   weight of 2 is equivalent to repeating that row twice. Negative weights are not
   allowed. Note: Weights are per-row observation weights and do not increase the
   size of the data frame. This is typically the number of times a row is repeated,
   but non-integer values are supported as well. During training, rows with higher
   weights matter more, due to the larger loss function pre-factor.

score_each_iteration
   Logical. Whether to score during each iteration of model training. Defaults to
   FALSE.

categorical_encoding
   Encoding scheme for categorical features Must be one of: "AUTO", "Enum",
   "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-
   ByResponse", "EnumLimited". Defaults to AUTO.

overwrite_with_best_model
   Logical. If enabled, override the final model with the best model found during
   training. Defaults to TRUE.

epochs
   How many times the dataset should be iterated (streamed), can be fractional.
   Defaults to 10.

train_samples_per_iteration
   Number of training samples (globally) per MapReduce iteration. Special val-
   ues are 0: one epoch, -1: all available data (e.g., replicated training data), -2:
   automatic. Defaults to -2.

target_ratio_comm_to_comp
   Target ratio of communication overhead to computation. Only for multi-node
   operation and train_samples_per_iteration = -2 (auto-tuning). Defaults to 0.05.

seed
   Seed for random numbers (affects certain parts of the algo that are stochastic
   and those might or might not be enabled by default). Note: only reproducible
   when running single threaded. Defaults to -1 (time-based random number).

standardize
   Logical. If enabled, automatically standardize the data. If disabled, the user
   must provide properly scaled input data. Defaults to TRUE.

learning_rate
   Learning rate (higher => less stable, lower => slower convergence). Defaults to
   0.001.
learning_rate_annealing
   Learning rate annealing: rate / (1 + rate_annealing * samples). Defaults to 1e-06.

momentum_start
   Initial momentum at the beginning of training (try 0.5). Defaults to 0.9.

momentum_ramp
   Number of training samples for which momentum increases. Defaults to 10000.

momentum_stable
   Final momentum after the ramp is over (try 0.99). Defaults to 0.9.

distribution
   Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

score_interval
   Shortest time interval (in seconds) between model scoring. Defaults to 5.

score_training_samples
   Number of training set samples for scoring (0 for all). Defaults to 10000.

score_validation_samples
   Number of validation set samples for scoring (0 for all). Defaults to 0.

score_duty_cycle
   Maximum duty cycle fraction for scoring (lower: more training, higher: more scoring). Defaults to 0.1.

classification_stop
   Stopping criterion for classification error fraction on training data (-1 to disable). Defaults to 0.

regression_stop
   Stopping criterion for regression error (MSE) on training data (-1 to disable). Defaults to 0.

stopping_rounds
   Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 5.

stopping_metric
   Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
   Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.

max_runtime_secs
   Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

ignore_const_cols
   Logical. Ignore constant columns. Defaults to TRUE.

shuffle_training_data
   Logical. Enable global shuffling of training data. Defaults to TRUE.

mini_batch_size
   Mini-batch size (smaller leads to better fit, larger can speed up and generalize better). Defaults to 32.

clip_gradient
   Clip gradients once their absolute value is larger than this value. Defaults to 10.
### network
Network architecture. Must be one of: "auto", "user", "lenet", "alexnet", "vgg", "googlenet", "inception_bn", "resnet". Defaults to auto.

### backend
Deep Learning Backend. Must be one of: "mxnet", "caffe", "tensorflow". Defaults to mxnet.

### image_shape
Width and height of image. Defaults to c(0, 0).

### channels
Number of (color) channels. Defaults to 3.

### sparse
Logical. Sparse data handling (more efficient for data with lots of 0 values). Defaults to FALSE.

### gpu
Logical. Whether to use a GPU (if available). Defaults to TRUE.

### device_id
Device IDs (which GPUs to use). Defaults to c(0).

### cache_data
Logical. Whether to cache the data in memory (automatically disabled if data size is too large). Defaults to TRUE.

### network_definition_file
Path of file containing network definition (graph, architecture).

### network_parameters_file
Path of file containing network (initial) parameters (weights, biases).

### mean_image_file
Path of file containing the mean image data for data normalization.

### export_native_parameters_prefix
Path (prefix) where to export the native model parameters after every iteration.

### activation
Activation function. Only used if no user-defined network architecture file is provided, and only for problem_type=dataset. Must be one of: "Rectifier", "Tanh".

### hidden
Hidden layer sizes (e.g. [200, 200]). Only used if no user-defined network architecture file is provided, and only for problem_type=dataset.

### input_dropout_ratio
Input layer dropout ratio (can improve generalization, try 0.1 or 0.2). Defaults to 0.

### hidden_dropout_ratios
Hidden layer dropout ratios (can improve generalization), specify one value per hidden layer, defaults to 0.5.

### problem_type
Problem type, auto-detected by default. If set to image, the H2OFrame must contain a string column containing the path (URI or URL) to the images in the first column. If set to text, the H2OFrame must contain a string column containing the text in the first column. If set to dataset, Deep Water behaves just like any other H2O Model and builds a model on the provided H2OFrame (non-String columns). Must be one of: "auto", "image", "dataset". Defaults to auto.

### export_checkpoints_dir
Automatically export generated models to this directory.
h2o.deepwater.available

*Determine whether Deep Water is available*

**Description**

Ask the H2O server whether a Deep Water model can be built. (Depends on availability of native backends.) Returns TRUE if a Deep Water model can be built, or FALSE otherwise.

**Usage**

```r
h2o.deepwater.available(h2oRestApiVersion = .h2o.__REST_API_VERSION)
```

**Arguments**

- `h2oRestApiVersion` *(Optional)* Specific version of the REST API to use.

---

h2o.describe

*H2O Description of A Dataset*

**Description**

Reports the "Flow" style summary rollups on an instance of H2OFrame. Includes information about column types, mins/maxs/missing/zero counts/stds/number of levels.

**Usage**

```r
h2o.describe(frame)
```

**Arguments**

- `frame` An H2OFrame object.

**Value**

A table with the Frame stats.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
h2o.describe(prostate)
## End(Not run)
```
**h2o.difflag1**

*Conduct a lag 1 transform on a numeric H2OFrame column*

**Description**
Conduct a lag 1 transform on a numeric H2OFrame column

**Usage**

```r
h2o.difflag1(object)
```

**Arguments**

- `object`: H2OFrame object

**Value**
Returns an H2OFrame object.

---

**h2o.dim**

*Returns the number of rows and columns for an H2OFrame object.*

**Description**
Returns the number of rows and columns for an H2OFrame object.

**Usage**

```r
h2o.dim(x)
```

**Arguments**

- `x`: An H2OFrame object.

**See Also**

- `dim` for the base R implementation.
h2o.dimnames

Column names of an H2OFrame

Description
Column names of an H2OFrame

Usage
h2o.dimnames(x)

Arguments
x An H2OFrame object.

See Also
dimnames for the base R implementation.

h2o.distance

Compute a pairwise distance measure between all rows of two numeric H2OFrames.

Description
Compute a pairwise distance measure between all rows of two numeric H2OFrames.

Usage
h2o.distance(x, y, measure)

Arguments
x An H2OFrame object (large, references).
y An H2OFrame object (small, queries).
measure An optional string indicating what distance measure to use. Must be one of: "l1" - Absolute distance (L1-norm, >=0) "l2" - Euclidean distance (L2-norm, >=0) "cosine" - Cosine similarity (-1...1) "cosine_sq" - Squared Cosine similarity (0...1)

Examples
## Not run:
  h2o.init()
  prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
  prostate <- h2o.uploadFile(path = prostate_path)
  h2o.distance(prostate[11:30,], prostate[1:10,], "cosine")

## End(Not run)
**h2o.downloadAllLogs**  
*Download H2O Log Files to Disk*

**Description**

h2o.downloadAllLogs downloads all H2O log files to local disk in .zip format. Generally used for debugging purposes.

**Usage**

```r
h2o.downloadAllLogs(dirname = ".", filename = NULL)
```

**Arguments**

- **dirname**  
  (Optional) A character string indicating the directory that the log file should be saved in.

- **filename**  
  (Optional) A character string indicating the name that the log file should be saved to. Note that the saved format is .zip, so the file name must include the .zip extension.

**Examples**

```r
## Not run:
h2o.downloadAllLogs(dirname= "/your_directory_name/", filename = "autoh2o_log.zip")
## End(Not run)
```

---

**h2o.downloadCSV**  
*Download H2O Data to Disk*

**Description**

Download an H2O data set to a CSV file on the local disk

**Usage**

```r
h2o.downloadCSV(data, filename)
```

**Arguments**

- **data**  
  an H2OFrame object to be downloaded.

- **filename**  
  A string indicating the name that the CSV file should be saved to.

**Warning**

Files located on the H2O server may be very large! Make sure you have enough hard drive space to accommodate the entire file.
### Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

file_path <- paste(getwd(), "my_iris_file.csv", sep = .Platform$file.sep)
h2o.downloadCSV(iris_hf, file_path)
file.info(file_path)
file.remove(file_path)

## End(Not run)
```

### Description

Download the model in MOJO format.

### Usage

```r
h2o.download_mojo(model, path = getwd(), get_genmodel_jar = FALSE,
genmodel_name = "", genmodel_path = "")
```

### Arguments

- `model`: An H2OModel
- `path`: The path where MOJO file should be saved. Saved to current directory by default.
- `get_genmodel_jar`: If TRUE, then also download h2o-genmodel.jar and store it in either in the same folder
- `genmodel_name`: Custom name of genmodel jar.
- `genmodel_path`: Path to store h2o-genmodel.jar. If left blank and “get_genmodel_jar” is TRUE, then the h2o-genmodel.jar

### Value

Name of the MOJO file written to the path.

### Examples

```r
## Not run:
library(h2o)
h <- h2o.init()
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)
h2o.download_mojo(my_model) # save to the current working directory

## End(Not run)
```
h2o.download_pojo  Download the Scoring POJO (Plain Old Java Object) of an H2O Model

Description

Download the Scoring POJO (Plain Old Java Object) of an H2O Model

Usage

h2o.download_pojo(model, path = NULL, getjar = NULL, get_jar = TRUE, jar_name = '')

Arguments

model  An H2OModel
path   The path to the directory to store the POJO (no trailing slash). If NULL, then print to console. The file name will be a compilable java file name.
getjar (DEPRECATED) Whether to also download the h2o-genmodel.jar file needed to compile the POJO. This argument is now called 'get_jar'.
get_jar Whether to also download the h2o-genmodel.jar file needed to compile the POJO
jar_name Custom name of genmodel jar.

Value

If path is NULL, then pretty print the POJO to the console. Otherwise save it to the specified directory and return POJO file name.

Examples

## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)

h2o.download_pojo(my_model)  # print the model to screen
# h2o.download_pojo(my_model, getwd())  # save the POJO and jar file to the current working directory, NOT RUN
# h2o.download_pojo(my_model, get_jar = FALSE )  # save only the POJO to the current working directory, NOT RUN
h2o.download_pojo(my_model, getwd())  # save to the current working directory

## End(Not run)
**h2o.entropy**

Shannon entropy

**Description**

Return the Shannon entropy of a string column. If the string is empty, the entropy is 0.

**Usage**

`h2o.entropy(x)`

**Arguments**

- `x` The column on which to calculate the entropy.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
buys <- as.h2o(c("no", "no", "yes", "yes", "no", "yes", "no", "yes", "yes", "no"))
buys_entropy <- h2o.entropy(buys)
## End(Not run)
```

---

**h2o.exp**

Compute the exponential function of x

**Description**

Compute the exponential function of x

**Usage**

`h2o.exp(x)`

**Arguments**

- `x` An H2OFrame object.

**See Also**

`exp` for the base R implementation.
h2o.exportFile

Export an H2O Data Frame (H2OFrame) to a File or to a collection of Files.

Description

Exports an H2OFrame (which can be either VA or FV) to a file. This file may be on the H2O instance’s local filesystem, or to HDFS (preface the path with hdfs://) or to S3N (preface the path with s3n://).

Usage

h2o.exportFile(data, path, force = FALSE, sep = ",", compression = NULL, parts = 1)

Arguments

data
  An H2OFrame object.

path
  The path to write the file to. Must include the directory and also filename if exporting to a single file. May be prefaced with hdfs:// or s3n://. Each row of data appears as line of the file.

force
  logical, indicates how to deal with files that already exist.

sep
  The field separator character. Values on each line of the file will be separated by this character (default ",").

compression
  How to compress the exported dataset

parts
  integer, number of part files to export to. Default is to write to a single file. Large data can be exported to multiple 'part' files, where each part file contains subset of the data. User can specify the maximum number of part files or use value -1 to indicate that H2O should itself determine the optimal number of files. Parameter path will be considered to be a path to a directory if export to multiple part files is desired. Part files conform to naming scheme 'part-m-?????'.

Details

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

# These aren't real paths
# h2o.exportFile(iris_hf, path = "/path/on/h2o/server/filesystem/iris.csv")
# h2o.exportFile(iris_hf, path = "hdfs://path/in/hdfs/iris.csv")
# h2o.exportFile(iris_hf, path = "s3n://path/in/s3/iris.csv")
```

## End(Not run)
h2o.exportHDFS  Export a Model to HDFS

Description

Exports an H2OModel to HDFS.

Usage

h2o.exportHDFS(object, path, force = FALSE)

Arguments

- object an H2OModel class object.
- path The path to write the model to. Must include the directory and filename.
- force logical, indicates how to deal with files that already exist.

h2o.fillna  fillNA

Description

Fill NA's in a sequential manner up to a specified limit

Usage

h2o.fillna(x, method = "forward", axis = 1, maxlen = 1L)

Arguments

- x an H2OFrame
- method A String: "forward" or "backward"
- axis An Integer 1 for row-wise fill (default), 2 for column-wise fill
- maxlen An Integer for maximum number of consecutive NA's to fill

Value

An H2OFrame after filling missing values

Examples

## Not run:
library(h2o)
h2o.init()
fr_with_nas = h2o.createFrame(categorical_fraction = 0.0, missing_fraction = 0.7, rows = 6, 
cols = 2, seed = 123)
fr <- h2o.fillna(fr_with_nas, "forward", axis = 1, maxlen = 2L)
## End(Not run)
h2o.filterNACols  
Filter NA Columns

Description
Filter NA Columns

Usage
h2o.filterNACols(data, frac = 0.2)

Arguments
- data: A dataset to filter on.
- frac: The threshold of NAs to allow per column (columns >= this threshold are filtered)

Value
Returns a numeric vector of indexes that pertain to non-NA columns

h2o.findSynonyms  
Find synonyms using a word2vec model.

Description
Find synonyms using a word2vec model.

Usage
h2o.findSynonyms(word2vec, word, count = 20)

Arguments
- word2vec: A word2vec model.
- word: A single word to find synonyms for.
- count: The top 'count' synonyms will be returned.
**h2o.find_row_by_threshold**

*Find the threshold, give the max metric. No duplicate thresholds allowed*

**Description**

Find the threshold, give the max metric. No duplicate thresholds allowed

**Usage**

```python
h2o.find_row_by_threshold(object, threshold)
```

**Arguments**

- **object**: H2OBinomialMetrics
- **threshold**: number between 0 and 1

---

**h2o.find_threshold_by_max_metric**

*Find the threshold, give the max metric*

**Description**

Find the threshold, give the max metric

**Usage**

```python
h2o.find_threshold_by_max_metric(object, metric)
```

**Arguments**

- **object**: H2OBinomialMetrics
- **metric**: "F1," for example
h2o.floor

Take a single numeric argument and return a numeric vector with the largest integers

Description

floor takes a single numeric argument x and returns a numeric vector containing the largest integers not greater than the corresponding elements of x.

Usage

h2o.floor(x)

Arguments

x An H2OFrame object.

See Also

floor for the base R implementation.

h2o.flow

Open H2O Flow

Description

Open H2O Flow in your browser

Usage

h2o.flow()

h2o.gainsLift

Access H2O Gains/Lift Tables

Description

Retrieve either a single or many Gains/Lift tables from H2O objects.

Usage

h2o.gainsLift(object, ...)

## S4 method for signature 'H2OModel'
h2o.gainsLift(object, newdata, valid = FALSE, xval = FALSE, ...)

## S4 method for signature 'H2OModelMetrics'
h2o.gainsLift(object)
h2o.gbm

Build gradient boosted classification or regression trees

Description

Builds gradient boosted classification trees and gradient boosted regression trees on a parsed data set.  The default distribution function will guess the model type based on the response column type. In order to run properly, the response column must be an numeric for "gaussian" or an enum for "bernoulli" or "multinomial".

Arguments

- **object**: Either an H2OModel object or an H2OModelMetrics object.
- **...**: further arguments to be passed to/from this method.
- **newdata**: An H2OFrame object that can be scored on. Requires a valid response column.
- **valid**: Retrieve the validation metric.
- **xval**: Retrieve the cross-validation metric.

Details

The H2OModelMetrics version of this function will only take H2OBinomialMetrics objects.

Value

Calling this function on H2OModel objects returns a Gains/Lift table corresponding to the predict function.

See Also

predict for generating prediction frames, h2o.performance for creating H2OModelMetrics.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, distribution = "bernoulli",
                 training_frame = prostate, validation_frame = prostate, nfolds=3)
h2o.gainsLift(model) # extract training metrics
h2o.gainsLift(model, valid=TRUE) # extract validation metrics (here: the same)
h2o.gainsLift(model, xval =TRUE) # extract cross-validation metrics
h2o.gainsLift(model, newdata=prostate) # score on new data (here: the same)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.gainsLift(perf) # extract from existing metrics object
## End(Not run)
```
Usage

h2o.gbm(x, y, training_frame, model_id = NULL, validation_frame = NULL,
nfolds = 0, keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
keep_cross_validation_fold_assignment = FALSE,

r2_stopping = Inf, stopping_rounds = 0, stopping_metric = c("AUTO",
"deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC",
"lift_top_group", "misclassification", "AUCPR", "mean_per_class_error",
"custom", "custom_increasing"), stopping_tolerance = 0.001,
max_runtime_secs = 0, seed = -1, build_tree_one_node = FALSE,
learn_rate = 0.1, learn_rate_annealing = 1,
distribution = c("AUTO", "bernoulli", "quasibinomial", "multinomial",
"gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile",
"huber", "custom"), quantile_alpha = 0.5, tweedie_power = 1.5,
huber_alpha = 0.9, checkpoint = NULL, sample_rate = 1,
sample_rate_per_class = NULL, col_sample_rate = 1,
col_sample_rate_change_per_level = 1, col_sample_rate_per_tree = 1,
min_split_improvement = 1e-05, histogram_type = c("AUTO",
"UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin"),
max_abs_leafnode_pred = Inf, pred_noise_bandwidth = 0,
categorical_encoding = c("AUTO", "Enum", "OneHotInternal",
"OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse",
"EnumLimited"), calibrate_model = FALSE, calibration_frame = NULL,
custom_metric_func = NULL, custom_distribution_func = NULL,
export_checkpoints_dir = NULL, monotone_constraints = NULL,
check_constant_response = TRUE, verbose = FALSE)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.

model_id Destination id for this model; auto-generated if not specified.

validation_frame Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.

keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions
Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep_cross_validation_fold_assignment
Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

score_each_iteration
Logical. Whether to score during each iteration of model training. Defaults to FALSE.

score_tree_interval
Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

fold_assignment
Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column
Column with cross-validation fold index assignment per observation.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

offset_column
Offset column. This will be added to the combination of columns before applying the link function.

weights_column
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_hit_ratio_k
Max. number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable) Defaults to 0.

ntrees
Number of trees. Defaults to 50.

max_depth
Maximum tree depth. Defaults to 5.

min_rows
Fewest allowed (weighted) observations in a leaf. Defaults to 10.

nbins
For numerical columns (real/int), build a histogram of (at least) this many bins, then split at the best point Defaults to 20.

nbins_top_level
For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level Defaults to 1024.
nbins_cats  For categorical columns (factors), build a histogram of this many bins, then split
at the best point. Higher values can lead to more overfitting. Defaults to 1024.

r2_stopping  r2_stopping is no longer supported and will be ignored if set - please use stop-
ning_rounds, stopping_metric and stopping_tolerance instead. Previous version
of H2O would stop making trees when the R^2 metric equals or exceeds this
Defaults to 1.797693135e+308.

stopping_rounds  Early stopping based on convergence of stopping_metric. Stop if simple moving
average of length k of the stopping_metric does not improve for k:=stopping_rounds
scoring events (0 to disable) Defaults to 0.

stopping_metric  Metric to use for early stopping (AUTO: logloss for classification, deviance
for regression and anomaly_score for Isolation Forest). Note that custom
and custom_increasing can only be used in GBM and DRF with the Python
client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR",
"mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance  Relative tolerance for metric-based stopping criterion (stop if relative improve-
ment is not at least this much) Defaults to 0.001.

max_runtime_secs  Maximum allowed runtime in seconds for model training. Use 0 to disable.
Defaults to 0.

seed  Seed for random numbers (affects certain parts of the algo that are stochastic
and those might or might not be enabled by default). Defaults to -1 (time-based
random number).

build_tree_one_node  Logical. Run on one node only; no network overhead but fewer cpus used.
Suitable for small datasets. Defaults to FALSE.

learn_rate  Learning rate (from 0.0 to 1.0) Defaults to 0.1.

learn_rate_annealing  Scale the learning rate by this factor after each tree (e.g., 0.99 or 0.999) Defaults
to 1.

distribution  Distribution function Must be one of: "AUTO", "bernoulli", "quasibinomial",
"multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quan-
tile", "huber", "custom". Defaults to AUTO.

quantile_alpha  Desired quantile for Quantile regression, must be between 0 and 1. Defaults to
0.5.

tweedie_power  Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to
1.5.

huber_alpha  Desired quantile for Huber/M-regression (threshold between quadratic and lin-
ear loss, must be between 0 and 1). Defaults to 0.9.

checkpoint  Model checkpoint to resume training with.

sample_rate  Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

sample_rate_per_class  A list of row sample rates per class (relative fraction for each class, from 0.0 to
1.0), for each tree

col_sample_rate  Column sample rate (from 0.0 to 1.0) Defaults to 1.
col_sample_rate_change_per_level
Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col_sample_rate_per_tree
Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

min_split_improvement
Minimum relative improvement in squared error reduction for a split to happen Defaults to 1e-05.

histogram_type
What type of histogram to use for finding optimal split points Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.

max_abs_leafnode_pred
Maximum absolute value of a leaf node prediction Defaults to 1.797693135e+308.

pred_noise_bandwidth
Bandwidth (sigma) of Gaussian multiplicative noise ~N(1,sigma) for tree node predictions Defaults to 0.

categorical_encoding
Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "sortByResponse", "EnumLimited". Defaults to AUTO.

calibrate_model
Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration_frame
Calibration frame for Platt Scaling

custom_metric_func
Reference to custom evaluation function, format: 'language:keyName=funcName'

custom_distribution_func
Reference to custom distribution, format: 'language:keyName=funcName'

export_checkpoints_dir
Automatically export generated models to this directory.

monotone_constraints
A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

check_constant_response
Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.

verbose
Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

predict.H2OModel for prediction
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Run regression GBM on australia data
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
independent <- c("premax", "salmax", "minairtemp", "maxairtemp", "maxsst", "maxsoilmoist", "Max_czcs")
dependent <- "runoffnew"

h2o.gbm(y = dependent, x = independent, training_frame = australia, 
        ntrees = 3, max_depth = 3, min_rows = 2)

## End(Not run)
```

**h2o.generic**

Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.

**Description**

Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.

**Usage**

```r
h2o.generic(model_id = NULL, model_key = NULL, path = NULL)
```

**Arguments**

- `model_id` Destination id for this model; auto-generated if not specified.
- `model_key` Key to the self-contained model archive already uploaded to H2O.
- `path` Path to file with self-contained model archive.

**Examples**

```r
## Not run:
# library(h2o)
# h2o.init()

# generic_model <- h2o.genericModel("/path/to/model.zip")
# predictions <- h2o.predict(generic_model, dataset)

## End(Not run)
```
h2o.genericModel

Imports a model under given path, creating a Generic model with it.

Description

Usage example: generic_model <- h2o.genericModel(model_file_path = "/path/to/mojo.zip") predictions <- h2o.predict(generic_model, dataset)

Usage

h2o.genericModel(mojo_file_path)

Arguments

mojo_file_path  Filesystem path to the model imported

Value

Returns H2O Generic Model based on given embedded model

Examples

## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(),"/",mojo_original_name)

# Import the MOJO as Generic model
generic_model <- h2o.genericModel(mojo_original_path)

# Perform scoring with the generic model
generic_model.predictions <- h2o.predict(generic_model, data)

## End(Not run)

h2o.getAutoML

Get an R object that is a subclass of H2OAutoML

Description

Get an R object that is a subclass of H2OAutoML
Usage

h2o.getAutoML(project_name)

Arguments

project_name A string indicating the project_name of the automl instance to retrieve.

Value

Returns an object that is a subclass of H2OAutoML.

Examples

## Not run:
library(h2o)
h2o.init()
votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
votes_hf <- h2o.uploadFile(path = votes_path, header = TRUE)
aml <- h2o.automl(y = "Class", project_name="aml_housevotes",
                   training_frame = votes_hf, max_runtime_secs = 30)
automl_retrieved <- h2o.getAutoML("aml_housevotes")
## End(Not run)

---

h2o.getConnection Retrieve an H2O Connection

Description

Attempt to recover an h2o connection.

Usage

h2o.getConnection()

Value

Returns an H2OConnection object.

---

h2o.getFrame Get an R Reference to an H2O Dataset, that will NOT be GC’d by default

Description

Get the reference to a frame with the given id in the H2O instance.

Usage

h2o.getFrame(id)
h2o.getFutureModel

Description
Get future model

Usage
h2o.getFutureModel(object, verbose = FALSE)

Arguments
- object: H2OModel
- verbose: Print model progress to console. Default is FALSE

h2o.getGLMFullRegularizationPath

Description
Extract the full regularization path from a GLM model (assuming it was run with the lambda search option).

Usage
h2o.getGLMFullRegularizationPath(model)

Arguments
- model: an H2OModel corresponding from a h2o.glm call.
h2o.getGrid

Get a grid object from H2O distributed K/V store.

Description

Note that if neither cross-validation nor a validation frame is used in the grid search, then the training metrics will display in the "get grid" output. If a validation frame is passed to the grid, and nfolds = 0, then the validation metrics will display. However, if nfolds > 1, then cross-validation metrics will display even if a validation frame is provided.

Usage

h2o.getGrid(grid_id, sort_by, decreasing)

Arguments

grid_id ID of existing grid object to fetch
sort_by Sort the models in the grid space by a metric. Choices are "logloss", "residual_deviance", "mse", "auc", "accuracy", "precision", "recall", "f1", etc.
decreasing Specify whether sort order should be decreasing

Examples

```r
## Not run:
library(h2o)
library(jsonlite)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.grid("gbm", grid_id = "gbm_grid_id", x = c(1:4), y = 5,
        training_frame = iris_hf, hyper_params = list(ntrees = c(1, 2, 3)))
grid <- h2o.getGrid("gbm_grid_id")
# Get grid summary
summary(grid)
# Fetch grid models
model_ids <- grid@model_ids
models <- lapply(model_ids, function(id) { h2o.getModel(id)})
## End(Not run)
```

h2o.getId

Get back-end distributed key/value store id from an H2OFrame.

Description

Get back-end distributed key/value store id from an H2OFrame.

Usage

h2o.getId(x)
h2o.getModel

Arguments

x
An H2OFrame

Value

The id of the H2OFrame

Description

Returns a reference to an existing model in the H2O instance.

Usage

h2o.getModel(model_id)

Arguments

model_id
A string indicating the unique model_id of the model to retrieve.

Value

Returns an object that is a subclass of H2OModel.

Examples

## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
model_id <- h2o.gbm(x = 1:4, y = 5, training_frame = iris_hf)@model_id
model_retrieved <- h2o.getModel(model_id)

## End(Not run)

h2o.getModelTree

Fetches a single tree of a H2O model. This function is intended to be used on Gradient Boosting Machine models or Distributed Random Forest models.

Description

Usage example: airlines.data <- h2o.importFile(path = '/path/to/airlines_train.csv') gbm.model = h2o.gbm(x=c("Origin", "Dest", "Distance"),y="IsDepDelayed",training_frame=airlines.data ,model_id="gbm_trees_model")
tree <-h2o.getModelTree(gbm.model, 1, 1);
**Usage**

```r
h2o.getModelTree(model, tree_number, tree_class = NA)
```

**Arguments**

- **model**: Model with trees
- **tree_number**: Number of the tree in the model to fetch, starting with 1
- **tree_class**: Name of the class of the tree (if applicable). This value is ignored for regression and binomial response column, as there is only one tree built. As there is exactly one class per categorical level, name of tree’s class equals to the corresponding categorical level of response column.

**Value**

Returns an H2OTree object with detailed information about a tree.

---

**Usage**

```r
h2o.getTimezone()
```

**Description**

Get the Time Zone on the H2O cluster Returns a string

---

**Usage**

```r
h2o.getTypes(x)
```

**Arguments**

- **x**: An H2OFrame

**Value**

A list of types per column
**h2o.getVersion**  
*Get h2o version*

**Description**  
Get h2o version

**Usage**  
```
h2o.getVersion()
```

**h2o.get_ntrees_actual**  
*Retrieve actual number of trees for tree algorithms*

**Description**  
Retrieve actual number of trees for tree algorithms

**Usage**  
```
h2o.get_ntrees_actual(object)
```

**Arguments**

- **object**  
  An H2OModel object.

**h2o.giniCoef**  
*Retrieve the GINI Coefficient*

**Description**  
Retrieves the GINI coefficient from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training GINIvalue is returned. If more than one parameter is set to TRUE, then a named vector of GINIs are returned, where the names are "train", "valid" or "xval".

**Usage**  
```
h2o.giniCoef(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**  
  An H2OBinomialMetrics object.
- **train**  
  Retrieve the training GINI Coefficient
- **valid**  
  Retrieve the validation GINI Coefficient
- **xval**  
  Retrieve the cross-validation GINI Coefficient
See Also

h2o.auc for AUC, h2o.giniCoef for the GINI coefficient, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.giniCoef(perf)

## End(Not run)
```

---

**h2o.glm**

*Fit a generalized linear model*

**Description**

Fits a generalized linear model, specified by a response variable, a set of predictors, and a description of the error distribution.

**Usage**

```r
h2o.glm(x, y, training_frame, model_id = NULL, validation_frame = NULL,
nfolds = 0, seed = -1, keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
fold_column = NULL, ignore_const_cols = TRUE,
score_each_iteration = FALSE, offset_column = NULL,
weights_column = NULL, family = c("gaussian", "binomial",
"quasibinomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie",
"negativebinomial"), tweedie_variance_power = 0,
tweedie_link_power = 1, theta = 1e-10, solver = c("AUTO", "IRLSM",
"L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT",
"GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR"), alpha = NULL,
lambda = NULL, lambda_search = FALSE, early_stopping = TRUE,
nlambdas = -1, standardize = TRUE,
missing_values_handling = c("MeanImputation", "Skip", "PlugValues"),
plug_values = NULL, compute_p_values = FALSE,
remove_collinear_columns = FALSE, intercept = TRUE,
non_negative = FALSE, max_iterations = -1, objective_epsilon = -1,
beta_epsilon = 1e-04, gradient_epsilon = -1,
link = c("family_default", "identity", "logit", "log", "inverse",
"tweedie", "ologit"), prior = -1, lambda_min_ratio = -1,
```
h2o.glm

beta_constraints = NULL, max_active_predictors = -1,
interactions = NULL, interaction_pairs = NULL, obj_reg = -1,
export_checkpoints_dir = NULL, balance_classes = FALSE,
class_sampling_factors = NULL, max_after_balance_size = 5,
max_hit_ratio_k = 0, max_runtime_secs = 0,
custom_metric_func = NULL)

Arguments

x  (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.
y  The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame  Id of the training data frame.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
nfolds  Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
keep_cross_validation_models  Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions  Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment  Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
fold_assignment  Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column  Column with cross-validation fold index assignment per observation.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
offset_column  Offset column. This will be added to the combination of columns before applying the link function.
weights_column  Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the
size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

**family**

tweedie_variance_power
Tweedie variance power Defaults to 0.

tweedie_link_power
Tweedie link power Defaults to 1.

**theta**
Theta Defaults to 1e-10.

**solver**
AUTO will set the solver based on given data and the other parameters. IRLSM is fast on problems with small number of predictors and for lambda-search with L1 penalty, L_BFGS scales better for datasets with many columns. Must be one of: "AUTO", "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR". Defaults to AUTO.

**alpha**
Distribution of regularization between the L1 (Lasso) and L2 (Ridge) penalties. A value of 1 for alpha represents Lasso regression, a value of 0 produces Ridge regression, and anything in between specifies the amount of mixing between the two. Default value of alpha is 0 when SOLVER = 'L-BFGS'; 0.5 otherwise.

**lambda**
Regularization strength

**lambda_search** Logical. Use lambda search starting at lambda max, given lambda is then interpreted as lambda min Defaults to FALSE.

**early_stopping** Logical. Stop early when there is no more relative improvement on train or validation (if provided) Defaults to TRUE.

**nlambdas**
Number of lambdas to be used in a search. Default indicates: If alpha is zero, with lambda search set to True, the value of nlambdas is set to 30 (fewer lambdas are needed for ridge regression) otherwise it is set to 100. Defaults to -1.

**standardize** Logical. Standardize numeric columns to have zero mean and unit variance Defaults to TRUE.

**missing_values_handling**
Handling of missing values. Either MeanImputation, Skip or PlugValues. Must be one of: "MeanImputation", "Skip", "PlugValues". Defaults to MeanImputation.

**plug_values**
Plug Values (a single row frame containing values that will be used to impute missing values of the training/validation frame, use with conjunction missing_values_handling = PlugValues)

**compute_p_values** Logical. Request p-values computation, p-values work only with IRLSM solver and no regularization Defaults to FALSE.

**remove_collinear_columns** Logical. In case of linearly dependent columns, remove some of the dependent columns Defaults to FALSE.

**intercept** Logical. Include constant term in the model Defaults to TRUE.

**non_negative** Logical. Restrict coefficients (not intercept) to be non-negative Defaults to FALSE.
max_iterations  Maximum number of iterations Defaults to -1.

objective_epsilon  Converge if objective value changes less than this. Default indicates: If lambda_search is set to True the value of objective_epsilon is set to .0001. If the lambda_search is set to False and lambda is equal to zero, the value of objective_epsilon is set to .000001, for any other value of lambda the default value of objective_epsilon is set to .0001. Defaults to -1.

beta_epsilon  Converge if beta changes less (using L-infinity norm) than beta epsilon, ONLY applies to IRLSM solver Defaults to 0.0001.

gradient_epsilon  Converge if objective changes less (using L-infinity norm) than this, ONLY applies to L-BFGS solver. Default indicates: If lambda_search is set to False and lambda is equal to zero, the default value of gradient_epsilon is equal to .000001, otherwise the default value is .0001. If lambda_search is set to True, the conditional values above are 1E-8 and 1E-6 respectively. Defaults to -1.

link  Link function. Must be one of: "family_default", "identity", "logit", "log", "inverse", "tweedie", "ologit". Defaults to family_default.

prior  Prior probability for y==1. To be used only for logistic regression iff the data has been sampled and the mean of response does not reflect reality. Defaults to -1.

lambda_min_ratio  Minimum lambda used in lambda search, specified as a ratio of lambda_max (the smallest lambda that drives all coefficients to zero). Default indicates: if the number of observations is greater than the number of variables, then lambda_min_ratio is set to 0.0001; if the number of observations is less than the number of variables, then lambda_min_ratio is set to 0.01. Defaults to -1.

beta_constraints  Beta constraints

max_active_predictors  Maximum number of active predictors during computation. Use as a stopping criterion to prevent expensive model building with many predictors. Default indicates: If the IRLSM solver is used, the value of max_active_predictors is set to 5000 otherwise it is set to 100000000. Defaults to -1.

interactions  A list of predictor column indices to interact. All pairwise combinations will be computed for the list.

interaction_pairs  A list of pairwise (first order) column interactions.

obj_reg  Likelihood divider in objective value computation, default is 1/nobs Defaults to -1.

export_checkpoints_dir  Automatically export generated models to this directory.

balance_classes  Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors  Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size  Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.
**max_hit_ratio_k**

Maximum number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable) Defaults to 0.

**max_runtime_secs**

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

**custom_metric_func**

Reference to custom evaluation function, format: ‘language:keyName=funcName’

**Value**

A subclass of `H2OModel` is returned. The specific subclass depends on the machine learning task at hand (if it’s binomial classification, then an `H2OBinomialModel` is returned, if it’s regression then a `H2ORegressionModel` is returned). The default print-out of the models is shown, but further GLM-specific information can be queried out of the object. To access these various items, please refer to the seealso section below. Upon completion of the GLM, the resulting object has coefficients, normalized coefficients, residual/null deviance, aic, and a host of model metrics including MSE, AUC (for logistic regression), degrees of freedom, and confusion matrices. Please refer to the more in-depth GLM documentation available here: [https://h2o-release.s3.amazonaws.com/h2o-dev/rel-shannon/2/docs-website/h2o-docs/index.html#Data+Science+Algorithms-GLM](https://h2o-release.s3.amazonaws.com/h2o-dev/rel-shannon/2/docs-website/h2o-docs/index.html#Data+Science+Algorithms-GLM)

**See Also**

bank = h2o.importFile(
  path="https://s3.amazonaws.com/h2o-public-test-data/smalldata/demos/bank-additional-full.csv"
)
predictors = 1:20
target="y"

glm = h2o.glm(x=predictors, y=target, training_frame=bank, family="binomial", standardize=TRUE,
             lambda_search=TRUE)

h2o.std_coef_plot(glm, num_of_features = 20)

## End(Not run)
```
Generalized low rank decomposition of an H2O data frame

Description

Builds a generalized low rank decomposition of an H2O data frame

Usage

Arguments

training_frame  Id of the training data frame.
cols  (Optional) A vector containing the data columns on which k-means operates.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
loading_name  Frame key to save resulting X.
transform  Transformation of training data Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.
k  Rank of matrix approximation Defaults to 1.
loss_by_col_idx
Loss function by column index (override)

multi_loss
Categorical loss function Must be one of: "Categorical", "Ordinal". Defaults to Categorical.

period
Length of period (only used with periodic loss function) Defaults to 1.

regularization_x
Regularization function for X matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". Defaults to None.

regularization_y
Regularization function for Y matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". Defaults to None.

gamma_x
Regularization weight on X matrix Defaults to 0.

gamma_y
Regularization weight on Y matrix Defaults to 0.

max_iterations
Maximum number of iterations Defaults to 1000.

max_updates
Maximum number of updates, defaults to 2*max_iterations Defaults to 2000.

init_step_size
Initial step size Defaults to 1.

min_step_size
Minimum step size Defaults to 0.0001.

seed
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

init
Initialization mode Must be one of: "Random", "SVD", "PlusPlus", "User". Defaults to PlusPlus.

svd_method
Method for computing SVD during initialization (Caution: Randomized is currently experimental and unstable) Must be one of: "GramSVD", "Power", "Randomized". Defaults to Randomized.

user_y
User-specified initial Y

user_x
User-specified initial X

expand_user_y
Logical. Expand categorical columns in user-specified initial Y Defaults to TRUE.

impute_original
Logical. Reconstruct original training data by reversing transform Defaults to FALSE.

recover_svd
Logical. Recover singular values and eigenvectors of XY Defaults to FALSE.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

export_checkpoints_dir
Automatically export generated models to this directory.

Value
an object of class H2ODimReductionModel.
h2o.grep

Search for matches to an argument pattern

Description

Searches for matches to argument 'pattern' within each element of a string column.

Usage

h2o.grep(pattern, x, ignore.case = FALSE, invert = FALSE, output.logical = FALSE)

Arguments

pattern A character string containing a regular expression.
x An H2O frame that wraps a single string column.
ignore.case If TRUE case is ignored during matching.
invert Identify elements that do not match the pattern.
output.logical If TRUE returns logical vector of indicators instead of list of matching positions

Details

This function has similar semantics as R’s native grep function and it supports a subset of its parameters. Default behavior is to return indices of the elements matching the pattern. Parameter 'output.logical' can be used to return a logical vector indicating if the element matches the pattern (1) or not (0).

References

See Also

h2o.kmeans, h2o.svd, h2o.prcomp

Examples

```r
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.glrm(training_frame = australia, k = 5, loss = "Quadratic", regularization_x = "L1",
        gamma_x = 0.5, gamma_y = 0, max_iterations = 1000)
## End(Not run)
```
Value

H2OFrame holding the matching positions or a logical vector if ‘output.logical’ is enabled.

Examples

```r
## Not run:
library(h2o)
h2o.init()
addresses <- as.h2o(c("2307", "Leghorn St", "Mountain View", "CA", "94043"))
zip.codes <- addresses[, \ h2o.grep("[0-9]{5}", addresses, output.logical = TRUE),]
## End(Not run)
```
search_criteria
(Optional) List of control parameters for smarter hyperparameter search. The list can include values for: strategy, max_models, max_runtime_secs, stopping_metric, stopping_tolerance, stopping_rounds and seed. The default strategy 'Cartesian' covers the entire space of hyperparameter combinations. If you want to use cartesian grid search, you can leave the search_criteria argument unspecified. Specify the "RandomDiscrete" strategy to get random search of all the combinations of your hyperparameters with three ways of specifying when to stop the search: max number of models, max time, and metric-based early stopping (e.g., stop if MSE has not improved by 0.0001 over the 5 best models). Examples below:

- `list(strategy = "RandomDiscrete", max_runtime_secs = 600, max_models = 100, stopping_metric = "AUTO", stopping_tolerance = 0.0001, stopping_rounds = 5, seed = 123456)`
- `list(strategy = "RandomDiscrete", max_models = 42, max_runtime_secs = 28800)`
- `list(strategy = "RandomDiscrete", stopping_metric = "AUTO", stopping_tolerance = 0.001, stopping_rounds = 10)`
- `list(strategy = "RandomDiscrete", stopping_metric = "misclassification", stopping_tolerance = 0.00001, stopping_rounds = 5)`

Details
Launch grid search with given algorithm and parameters.

Examples
```r
## Not run:
library(h2o)
library(jsonlite)
h2o.init()
iris_hf <- as.h2o(iris)
grid <- h2o.grid("gbm", x = c(1:4), y = 5, training_frame = iris_hf,
  hyper_params = list(ntrees = c(1, 2, 3)))
# Get grid summary
summary(grid)
# Fetch grid models
model_ids <- grid@model_ids
models <- lapply(model_ids, function(id) { h2o.getModel(id)})
## End(Not run)
```

h2o.group_by
Group and Apply by Column

Description
Performs a group by and apply similar to ddply.

Usage
```r
h2o.group_by(data, by, ..., gb.control = list(na.methods = NULL,
col.names = NULL))
```

Arguments
- `data` an H2OFrame object.
- `by` a list of column names.
Details

In the case of `na.methods` within `gb.control`, there are three possible settings. "all" will include NAs in computation of functions. "rm" will completely remove all NA fields. "ignore" will remove NAs from the numerator but keep the rows for computational purposes. If a list smaller than the number of columns groups is supplied, the list will be padded by "ignore".

Note that to specify a list of column names in the `gb.control` list, you must add the `col.names` argument. Similar to `na.methods`, `col.names` will pad the list with the default column names if the length is less than the number of columns groups supplied.

Supported functions include `nrow`. This function is required and accepts a string for the name of the generated column. Other supported aggregate functions accept `col` and `na` arguments for specifying columns and the handling of NAs ("all", "ignore", and `GroupBy` object; `max` calculates the maximum of each column specified in `col` for each group of a `GroupBy` object; `mean` calculates the mean of each column specified in `col` for each group of a `GroupBy` object; `min` calculates the minimum of each column specified in `col` for each group of a `GroupBy` object; `mode` calculates the mode of each column specified in `col` for each group of a `GroupBy` object; `sd` calculates the standard deviation of each column specified in `col` for each group of a `GroupBy` object; `ss` calculates the sum of squares of each column specified in `col` for each group of a `GroupBy` object; `sum` calculates the sum of each column specified in `col` for each group of a `GroupBy` object; and `var` calculates the variance of each column specified in `col` for each group of a `GroupBy` object. If an aggregate is provided without a value (for example, as `max` in `sum(col="X1", na="all") . mean(col="X5", na="all") . max()`), then it is assumed that the aggregation should apply to all columns except the `GroupBy` columns. However, operations will not be performed on String columns. They will be skipped. Note again that `nrow` is required and cannot be empty.

Value

Returns a new `H2OFrame` object with columns equivalent to the number of groups created

---

h2o.gsub

String Global Substitute

Description

Creates a copy of the target column in which each string has all occurrence of the regex pattern replaced with the replacement substring.

Usage

```r
h2o.gsub(pattern, replacement, x, ignore.case = FALSE)
```

Arguments

- `pattern` The pattern to replace.
- `replacement` The replacement pattern.
- `x` The column on which to operate.
- `ignore.case` Case sensitive or not
Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_gsub <- as.h2o("r tutorial")
sub_string <- h2o.gsub("r ", "H2O ", string_to_gsub)
## End(Not run)
```

h2o.head

**Return the Head or Tail of an H2O Dataset.**

Description

Returns the first or last rows of an H2OFrame object.

Usage

```r
h2o.head(x, n = 6L, ...)
## S3 method for class 'H2OFrame'
head(x, n = 6L, ...)
```

```r
h2o.tail(x, n = 6L, ...)
## S3 method for class 'H2OFrame'
tail(x, n = 6L, ...)
```

Arguments

- **x**: An H2OFrame object.
- **n**: (Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x.
- **...**: Ignored.

Value

An H2OFrame containing the first or last n rows of an H2OFrame object.

Examples

```r
## Not run:
library(h2o)
h2o.init(ip <- "localhost", port = 54321, startH2O = TRUE)
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
head(australia, 10)
tail(australia, 10)
## End(Not run)
```
**h2o.hist**  
*Compute A Histogram*

**Description**

Compute a histogram over a numeric column. If `breaks`="FD", the MAD is used over the IQR in computing bin width. Note that we do not beautify the breakpoints as R does.

**Usage**

```r
h2o.hist(x, breaks = "Sturges", plot = TRUE)
```

**Arguments**

- `x`: A single numeric column from an H2OFrame.
- `breaks`: Can be one of the following: A string: "Sturges", "Rice", "sqrt", "Doane", "FD", "Scott" A single number for the number of breaks splitting the range of the vec into number of breaks bins of equal width A vector of numbers giving the split points, e.g., c(-50,213.2123,9324834)
- `plot`: A logical value indicating whether or not a plot should be generated (default is TRUE).

**h2o.hit_ratio_table**  
*Retrieve the Hit Ratios*

**Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training Hit Ratios value is returned. If more than one parameter is set to TRUE, then a named list of Hit Ratio tables are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.hit_ratio_table(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- `object`: An H2OModel object.
- `train`: Retrieve the training Hit Ratio
- `valid`: Retrieve the validation Hit Ratio
- `xval`: Retrieve the cross-validation Hit Ratio
**h2o.hour**

*Convert Milliseconds to Hour of Day in H2O Datasets*

**Description**

Converts the entries of an H2OFrame object from milliseconds to hours of the day (on a 0 to 23 scale).

**Usage**

```r
h2o.hour(x)
hour(x)
```

```r
## S3 method for class 'H2OFrame'
hour(x)
```

**Arguments**

- **x**: An H2OFrame object.

**Value**

An H2OFrame object containing the entries of x converted to hours of the day.

**See Also**

- `h2o.day`

**h2o.ifelse**

*H2O Apply Conditional Statement*

**Description**

Applies conditional statements to numeric vectors in H2O parsed data objects when the data are numeric.

**Usage**

```r
h2o.ifelse(test, yes, no)
ifelse(test, yes, no)
```

**Arguments**

- **test**: A logical description of the condition to be met (> , <, =, etc...)
- **yes**: The value to return if the condition is TRUE.
- **no**: The value to return if the condition is FALSE.
Details

Both numeric and categorical values can be tested. However when returning a yes and no condition both conditions must be either both categorical or numeric.

Value

Returns a vector of new values matching the conditions stated in the ifelse call.

Examples

```r
## Not run:
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.importFile(path = australia_path)
australia[,9] <- ifelse(australia[,3] < 279.9, 1, 0)
summary(australia)
## End(Not run)
```

---

**h2o.importFile**  
**Import Files into H2O**

Description

Imports files into an H2O cluster. The default behavior is to pass-through to the parse phase automatically.

Usage

```r
h2o.importFile(path, destination_frame = "", parse = TRUE,  
header = NA, sep = "", col.names = NULL, col.types = NULL,  
na.strings = NULL, decrypt_tool = NULL, skipped_columns = NULL,  
custom_non_data_line_markers = NULL)
```

```r
h2o.importFolder(path, pattern = "", destination_frame = "",  
parse = TRUE, header = NA, sep = "", col.names = NULL,  
col.types = NULL, na.strings = NULL, decrypt_tool = NULL,  
skipped_columns = NULL, custom_non_data_line_markers = NULL)
```

```r
h2o.importHDFS(path, pattern = "", destination_frame = "",  
parse = TRUE, header = NA, sep = "", col.names = NULL,  
na.strings = NULL)
```

```r
h2o.uploadFile(path, destination_frame = "", parse = TRUE,  
header = NA, sep = "", col.names = NULL, col.types = NULL,  
na.strings = NULL, progressBar = FALSE, parse_type = NULL,  
decrypt_tool = NULL, skipped_columns = NULL)
```
Arguments

path
The complete URL or normalized file path of the file to be imported. Each row of data appears as one line of the file.

destination_frame
(Optional) The unique hex key assigned to the imported file. If none is given, a key will automatically be generated based on the URL path.

parse
(Optional) A logical value indicating whether the file should be parsed after import, for details see h2o.parseRaw.

header
(Optional) A logical value indicating whether the first line of the file contains column headers. If left empty, the parser will try to automatically detect this.

sep
(Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.

col.names
(Optional) An H2OFrame object containing a single delimited line with the column names for the file.

col.types
(Optional) A vector to specify whether columns should be forced to a certain type upon import parsing.

na.strings
(Optional) H2O will interpret these strings as missing.

decrypt_tool
(Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup.

skipped_columns
a list of column indices to be skipped during parsing.

custom_non_data_line_markers
(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used

pattern
(Optional) Character string containing a regular expression to match file(s) in the folder.

progressBar
(Optional) When FALSE, tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.

parse_type
(Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"

Details

h2o.importFile is a parallelized reader and pulls information from the server from a location specified by the client. The path is a server-side path. This is a fast, scalable, highly optimized way to read data. H2O pulls the data from a data store and initiates the data transfer as a read operation.

Unlike the import function, which is a parallelized reader, h2o.uploadFile is a push from the client to the server. The specified path must be a client-side path. This is not scalable and is only intended for smaller data sizes. The client pushes the data from a local filesystem (for example, on your machine where R is running) to H2O. For big-data operations, you don’t want the data stored on or flowing through the client.

h2o.importFolder imports an entire directory of files. If the given path is relative, then it will be relative to the start location of the H2O instance. The default behavior is to pass-through to the parse phase automatically.

h2o.importHDFS is deprecated. Instead, use h2o.importFile.
h2o.import_hive_table

**Import Hive Table into H2O**

**Description**

Import Hive table to H2OFrame in memory. Make sure to start H2O with Hive on classpath. Uses hive-site.xml on classpath to connect to Hive.

**Usage**

```r
h2o.import_hive_table(database, table, partitions = NULL, allow_multi_format = FALSE)
```

**Arguments**

- `database`: Name of Hive database (default database will be used by default)
- `table`: name of Hive table to import
- `partitions`: a list of lists of strings - partition key column values of partitions you want to import.
- `allow_multi_format`: enable import of partitioned tables with different storage formats used. WARNING: this may fail on out-of-memory for tables with a large number of small partitions.

**Details**

For example, `my_citibike_data = h2o.import_hive_table("default","citibike20k", partitions = list(c("2017","01"), c("2017","02")))`
h2o.import_mojo

Imports a MOJO under given path, creating a Generic model with it.

Description

Usage example: mojo_model <- h2o.import_mojo(model_file_path = "/path/to/mojo.zip") predictions <- h2o.predict(mojo_model, dataset)

Usage

h2o.import_mojo(mojo_file_path)

Arguments

mojo_file_path  Filesystem path to the model imported

Value

Returns H2O Generic Model embedding given MOJO model

Examples

## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(), "/", mojo_original_name)

# Import the MOJO and obtain a Generic model
mojo_model <- h2o.import_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)

h2o.import_sql_select

Import SQL table that is result of SELECT SQL query into H2O

Description

Creates a temporary SQL table from the specified sql_query. Runs multiple SELECT SQL queries on the temporary table concurrently for parallel ingestion, then drops the table. Be sure to start the h2o.jar in the terminal with your downloaded JDBC driver in the classpath: `java -cp <path_to_h2o_jar>:<path_to_jdbc_driver_jar> water.H2OApp`. Also see h2o.import_sql_table. Currently supported SQL databases are MySQL, PostgreSQL, MariaDB, Hive, Oracle and Microsoft SQL Server.
Usage

h2o.import_sql_select(connection_url, select_query, username, password,
use_temp_table = NULL, temp_table_name = NULL, optimize = NULL,
fetch_mode = NULL)

Arguments

collection_url  URL of the SQL database connection as specified by the Java Database Connectivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?&useSSL=false"
select_query  SQL query starting with 'SELECT' that returns rows from one or more database tables.
username  Username for SQL server
password  Password for SQL server
use_temp_table  Whether a temporary table should be created from select_query
temp_table_name  Name of temporary table to be created from select_query
optimize  (Optional) Optimize import of SQL table for faster imports. Experimental. Default is true.
fetch_mode  (Optional) Set to DISTRIBUTED to enable distributed import. Set to SINGLE to force a sequential read from the database. Can be used for databases that do not support OFFSET-like clauses in SQL statements.

Details

For example, my_sql_conn_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?&useSSL=false" select_query <- "SELECT bikeid from citibike20k" username <- "root" password <- "abc123" my_citibike_data <- h2o.import_sql_select(my_sql_conn_url, select_query, username, password)

h2o.import_sql_table  Import SQL Table into H2O

Description

Imports SQL table into an H2O cluster. Assumes that the SQL table is not being updated and is stable. Runs multiple SELECT SQL queries concurrently for parallel ingestion. Be sure to start the h2o.jar in the terminal with your downloaded JDBC driver in the classpath: 'java -cp <path_to_h2o_jar>:<path_to_jdbc_driver_jar> water.H2OApp' Also see h2o.import_sql_select. Currently supported SQL databases are MySQL, PostgreSQL, MariaDB, Hive, Oracle and Microsoft SQL Server.

Usage

h2o.import_sql_table(connection_url, table, username, password,
columns = NULL, optimize = NULL, fetch_mode = NULL)
**h2o.impute**

**Arguments**

- **connection_url**: URL of the SQL database connection as specified by the Java Database Connectivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?&useSSL=false"
- **table**: Name of SQL table
- **username**: Username for SQL server
- **password**: Password for SQL server
- **columns**: (Optional) Character vector of column names to import from SQL table. Default is to import all columns.
- **optimize**: (Optional) Optimize import of SQL table for faster imports. Default is true. Ignored - use fetch_mode instead.
- **fetch_mode**: (Optional) Set to DISTRIBUTED to enable distributed import. Set to SINGLE to force a sequential read from the database. Can be used for databases that do not support OFFSET-like clauses in SQL statements.

**Details**

For example, my_sql_conn_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?&useSSL=false" table <- "citibike20k" username <- "root" password <- "abc123" my_citibike_data <- h2o.import_sql_table(my_sql_conn_url, table, username, password)

---

### h2o.impute

**Basic Imputation of H2O Vectors**

**Description**

Perform inplace imputation by filling missing values with aggregates computed on the "na.rm'd" vector. Additionally, it's possible to perform imputation based on groupings of columns from within data: these columns can be passed by index or name to the by parameter. If a factor column is supplied, then the method must be "mode".

**Usage**

```r
h2o.impute(data, column = 0, method = c("mean", "median", "mode"),
            combine_method = c("interpolate", "average", "lo", "hi"), by = NULL,
            groupByFrame = NULL, values = NULL)
```

**Arguments**

- **data**: The dataset containing the column to impute.
- **column**: A specific column to impute, default of 0 means impute the whole frame.
- **method**: "mean" replaces NAs with the column mean; "median" replaces NAs with the column median; "mode" replaces with the most common factor (for factor columns only);
- **combine_method**: If method is "median", then choose how to combine quantiles on even sample sizes. This parameter is ignored in all other cases.
- **by**: group by columns
- **groupByFrame**: Impute the column col with this pre-computed grouped frame.
- **values**: A vector of impute values (one per column). NaN indicates to skip the column.
Details

The default method is selected based on the type of the column to impute. If the column is numeric then "mean" is selected; if it is categorical, then "mode" is selected. Other column types (e.g. String, Time, UUID) are not supported.

Value

an H2OFrame with imputed values

Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
iris_hf[sample(nrow(iris_hf), 40), 5] <- NA  # randomly replace 50 values with NA
# impute with a group by
iris_hf <- h2o.impute(iris_hf, "Species", "mode", by = c("Sepal.Length", "Sepal.Width"))
## End(Not run)
```

h2o.init

Initialize and Connect to H2O

Description

Attempts to start and/or connect to and H2O instance.

Usage

```r
h2o.init(ip = "localhost", port = 54321, name = NA_character_,
startH2O = TRUE, forceDL = FALSE, enable_assertions = TRUE,
license = NULL, nthreads = -1, max_mem_size = NULL,
min_mem_size = NULL, ice_root = tempdir(), log_dir = NA_character_,
log_level = NA_character_, strict_version_check = TRUE,
proxy = NA_character_, https = FALSE, cacert = NA_character_,
insecure = FALSE, username = NA_character_,
password = NA_character_, use_spnego = FALSE,
cookies = NA_character_, context_path = NA_character_,
ignore_config = FALSE, extra_classpath = NULL,
jvm_custom_args = NULL, bind_to_localhost = TRUE)
```

Arguments

- **ip**: Object of class character representing the IP address of the server where H2O is running.
- **port**: Object of class numeric representing the port number of the H2O server.
- **name**: (Optional) A character string representing the H2O cluster name.
- **startH2O**: (Optional) A logical value indicating whether to try to start H2O from R if no connection with H2O is detected. This is only possible if `ip = "localhost"` or `ip = "127.0.0.1"`. If an existing connection is detected, R does not start H2O.
forceDL  (Optional) A logical value indicating whether to force download of the H2O executable. Defaults to FALSE, so the executable will only be downloaded if it does not already exist in the h2o R library resources directory h2o/java/h2o.jar. This value is only used when R starts H2O.

enable_assertions  (Optional) A logical value indicating whether H2O should be launched with assertions enabled. Used mainly for error checking and debugging purposes. This value is only used when R starts H2O.

license  (Optional) A character string value specifying the full path of the license file. This value is only used when R starts H2O.

nthreads  (Optional) Number of threads in the thread pool. This relates very closely to the number of CPUs used. -1 means use all CPUs on the host (Default). A positive integer specifies the number of CPUs directly. This value is only used when R starts H2O.

max_mem_size  (Optional) A character string specifying the maximum size, in bytes, of the memory allocation pool to H2O. This value must a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate gigabytes. This value is only used when R starts H2O.

min_mem_size  (Optional) A character string specifying the minimum size, in bytes, of the memory allocation pool to H2O. This value must a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate gigabytes. This value is only used when R starts H2O.

ice_root  (Optional) A directory to handle object spillage. The default varies by OS.

log_dir  (Optional) A directory where H2O server logs are stored. The default varies by OS.

log_level  (Optional) The level of logging of H2O server. The default is INFO.

strict_version_check  (Optional) Setting this to FALSE is unsupported and should only be done when advised by technical support.

proxy  (Optional) A character string specifying the proxy path.

https  (Optional) Set this to TRUE to use https instead of http.

cacert  (Optional) Path to a CA bundle file with root and intermediate certificates of trusted CAs.

insecure  (Optional) Set this to TRUE to disable SSL certificate checking.

username  (Optional) Username to login with.

password  (Optional) Password to login with.

use_spnego  (Optional) Set this to TRUE to enable SPNEGO authentication.

cookies  (Optional) Vector(or list) of cookies to add to request.

context_path  (Optional) The last part of connection URL: http://<ip>:<port>/<context_path>

ignore_config  (Optional) A logical value indicating whether a search for a .h2oconfig file should be conducted or not. Default value is FALSE.

extra_classpath  (Optional) A vector of paths to libraries to be added to the Java classpath when H2O is started from R.

jvm_custom_args  (Optional) A character list of custom arguments for the JVM where new H2O instance is going to run, if started. Ignored when connecting to an existing instance.
bind_to_localhost

(Optional) A logical flag indicating whether access to the H2O instance should be restricted to the local machine (default) or if it can be reached from other computers on the network. Only applicable when H2O is started from R.

Details

By default, this method first checks if an H2O instance is connectible. If it cannot connect and start = TRUE with ip = "localhost", it will attempt to start and instance of H2O at localhost:54321. If an open ip and port of your choice are passed in, then this method will attempt to start an H2O instance at that specified ip port.

When initializing H2O locally, this method searches for h2o.jar in the R library resources (system.file("java", "h2o.
and if the file does not exist, it will automatically attempt to download the correct version from Amazon S3. The user must have Internet access for this process to be successful.

Once connected, the method checks to see if the local H2O R package version matches the version of H2O running on the server. If there is a mismatch and the user indicates she wishes to upgrade, it will remove the local H2O R package and download/install the H2O R package from the server.

Value

this method will load it and return a H2OConnection object containing the IP address and port number of the H2O server.

Note

Users may wish to manually upgrade their package (rather than waiting until being prompted), which requires that they fully uninstall and reinstall the H2O package, and the H2O client package. You must unload packages running in the environment before upgrading. It’s recommended that users restart R or R studio after upgrading.

See Also

H2O R package documentation for more details. h2o.shutdown for shutting down from R.

Examples

## Not run:
# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R with the default settings.
h2o.init()

# Try to connect to a local H2O instance.
# If not found, raise an error.
h2o.init(startH2O = FALSE)

# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R with 5 gigabytes of memory.
h2o.init(max_mem_size = "5g")

# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R that uses 5 gigabytes of memory.
h2o.init(max_mem_size = "5g")

## End(Not run)
Insert Missing Values into an H2OFrame

Description

Randomly replaces a user-specified fraction of entries in an H2O dataset with missing values.

Usage

h2o.insertMissingValues(data, fraction = 0.1, seed = -1)

Arguments

data An H2OFrame object representing the dataset.
fraction A number between 0 and 1 indicating the fraction of entries to replace with missing.
seed A random number used to select which entries to replace with missing values. Default of seed = -1 will automatically generate a seed in H2O.

Value

Returns an H2OFrame object.

WARNING

This will modify the original dataset. Unless this is intended, this function should only be called on a subset of the original.

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
summary(iris_hf)

irismiss <- h2o.insertMissingValues(iris_hf, fraction = 0.25)
head(irismiss)
summary(irismiss)
## End(Not run)
```
**h2o.interaction**  
*Categorical Interaction Feature Creation in H2O*

**Description**

Creates a data frame in H2O with n-th order interaction features between categorical columns, as specified by the user.

**Usage**

```r
h2o.interaction(data, destination_frame, factors, pairwise, max_factors, min_occurrence)
```

**Arguments**

- **data**: An H2OFrame object containing the categorical columns.
- **destination_frame**: A string indicating the destination key. If empty, this will be auto-generated by H2O.
- **factors**: Factor columns (either indices or column names).
- **pairwise**: Whether to create pairwise interactions between factors (otherwise create one higher-order interaction). Only applicable if there are 3 or more factors.
- **max_factors**: Max. number of factor levels in pair-wise interaction terms (if enforced, one extra catch-all factor will be made)
- **min_occurrence**: Min. occurrence threshold for factor levels in pair-wise interaction terms

**Value**

Returns an H2OFrame object.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

# Create some random data
myframe <- h2o.createFrame(rows = 20, cols = 5,
    seed = -12301283, randomize = TRUE, value = 0,
    categorical_fraction = 0.8, factors = 10, real_range = 1,
    integer_fraction = 0.2, integer_range = 10,
    binary_fraction = 0, binary_ones_fraction = 0.5,
    missing_fraction = 0.2,
    response_factors = 1)

# Turn integer column into a categorical
myframe[,5] <- as.factor(myframe[,5])
head(myframe, 20)

# Create pairwise interactions
pairwise <- h2o.interaction(myframe,
    factors = list(c(1, 2), c("C2", "C3", "C4")),
    pairwise = TRUE,
    max_factors = 4,
    min_occurrence = 2)
head(pairwise, 20)
```
```r
head(pairwise, 20)
h2o.levels(pairwise, 2)

# Create 5-th order interaction
higherorder <- h2o.interaction(myframe, destination_frame = 'higherorder', factors = c(1,2,3,4,5),
                                pairwise = FALSE, max_factors = 10000, min_occurrence = 1)
head(higherorder, 20)

# Limit the number of factors of the "categoricalized" integer column
# to at most 3 factors, and only if they occur at least twice
head(trim_integer_levels, 20)

# Put all together
myframe <- h2o.cbind(myframe, pairwise, higherorder, trim_integer_levels)
head(myframe, 20)
summary(myframe)
```

### h2o.isax

**Description**

Compute the iSAX index for a DataFrame which is assumed to be numeric time series data

**Usage**

```r
h2o.isax(x, num_words, max_cardinality, optimize_card = FALSE)
```

**Arguments**

- `x`: an H2OFrame
- `num_words`: Number of iSAX words for the timeseries. ie granularity along the time series
- `max_cardinality`: Maximum cardinality of the iSAX word. Each word can have less than the max
- `optimize_card`: An optimization flag that will find the max cardinality regardless of what is passed in for max_cardinality.

**Value**

An H2OFrame with the name of time series, string representation of iSAX word, followed by binary representation

**References**

h2o.ischaracter  

**Description**  
Check if character

**Usage**  

```
h2o.ischaracter(x)
```

**Arguments**  

- `x`: An H2OFrame object.

**See Also**  

`is.character` for the base R implementation.

---

h2o.isfactor  

**Description**  
Check if factor

**Usage**  

```
h2o.isfactor(x)
```

**Arguments**  

- `x`: An H2OFrame object.

**See Also**  

`is.factor` for the base R implementation.
h2o.isnumeric  

**Check if numeric**

**Description**

Check if numeric

**Usage**

h2o.isnumeric(x)

**Arguments**

- **x**  
  An H2OFrame object.

**See Also**

- is.numeric for the base R implementation.

h2o.isolationForest  

**Trains an Isolation Forest model**

**Description**

Trains an Isolation Forest model

**Usage**

h2o.isolationForest(training_frame, x, model_id = NULL, score_each_iteration = FALSE, score_tree_interval = 0, ignore_const_cols = TRUE, ntrees = 50, max_depth = 8, min_rows = 1, max_runtime_secs = 0, seed = -1, build_tree_one_node = FALSE, mtries = -1, sample_size = 256, sample_rate = -1, col_sample_rate_change_per_level = 1, col_sample_rate_per_tree = 1, categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"), stopping_rounds = 0, stopping_metric = c("AUTO", "anomaly_score"), stopping_tolerance = 0.01, export_checkpoints_dir = NULL)

**Arguments**

- **training_frame**  
  Id of the training data frame.

- **x**  
  A vector containing the character names of the predictors in the model.

- **model_id**  
  Destination id for this model; auto-generated if not specified.

- **score_each_iteration**  
  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
score_tree_interval
Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

ntrees
Number of trees. Defaults to 50.

max_depth
Maximum tree depth. Defaults to 8.

min_rows
Fewest allowed (weighted) observations in a leaf. Defaults to 1.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

build_tree_one_node
Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries
Number of variables randomly sampled as candidates at each split. Set to -1, defaults (number of predictors)/3. Defaults to -1.

sample_size
Number of randomly sampled observations used to train each Isolation Forest tree. Only one of parameters sample_size and sample_rate should be defined. If sample_rate is defined, sample_size will be ignored. Defaults to 256.

sample_rate
Rate of randomly sampled observations used to train each Isolation Forest tree. Needs to be in range from 0.0 to 1.0. If set to -1, sample_rate is disabled and sample_size will be used instead. Defaults to -1.

col_sample_rate_change_per_level
Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col_sample_rate_per_tree
Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

categorical_encoding
Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "anomaly_score". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.01.

export_checkpoints_dir
Automatically export generated models to this directory.
**h2o.is_client**

**Check Client Mode Connection**

**Description**

Check Client Mode Connection

**Usage**

`h2o.is_client()`

---

**h2o.keyof**

**Method on Keyed objects allowing to obtain their key.**

**Description**

Method on Keyed objects allowing to obtain their key.

**Usage**

`h2o.keyof(object)`

```r
## S4 method for signature 'Keyed'
h2o.keyof(object)

## S4 method for signature 'H2OModel'
h2o.keyof(object)

## S4 method for signature 'H2OFrame'
h2o.keyof(object)

## S4 method for signature 'H2OAutoML'
h2o.keyof(object)
```

**Arguments**

- `object` A Keyed object

**Value**

the string key holding the persistent object.
h2o.kfold_column  
*Produce a k-fold column vector.*

**Description**

Create a k-fold vector useful for H2O algorithms that take a fold_assignments argument.

**Usage**

```r
h2o.kfold_column(data, nfolds, seed = -1)
```

**Arguments**

- `data`: A dataframe against which to create the fold column.
- `nfolds`: The number of desired folds.
- `seed`: A random seed, -1 indicates that H2O will choose one.

**Value**

Returns an H2OFrame object with fold assignments.

h2o.killMinus3  
*Dump the stack into the JVM’s stdout.*

**Description**

A poor man’s profiler, but effective.

**Usage**

```r
h2o.killMinus3()
```

h2o.kmeans  
*Performs k-means clustering on an H2O dataset*

**Description**

Performs k-means clustering on an H2O dataset
Usage

h2o.kmeans(training_frame, x, model_id = NULL, validation_frame = NULL,
nfolds = 0, keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
fold_column = NULL, ignore_const_cols = TRUE,
score_each_iteration = FALSE, k = 1, estimate_k = FALSE,
user_points = NULL, max_iterations = 10, standardize = TRUE,
seed = -1, init = c("Random", "PlusPlus", "Furthest", "User"),
max_runtime_secs = 0, categorical_encoding = c("AUTO", "Enum",
"OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder",
"SortByResponse", "EnumLimited"), export_checkpoints_dir = NULL)

Arguments

training_frame  Id of the training data frame.
x  A vector containing the character names of the predictors in the model.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
nfolds  Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
keep_cross_validation_models  Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions  Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment  Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
fold_assignment  Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column  Column with cross-validation fold index assignment per observation.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
k  The max. number of clusters. If estimate_k is disabled, the model will find k centroids, otherwise it will find up to k centroids. Defaults to 1.
estimate_k  Logical. Whether to estimate the number of clusters (<=k) iteratively and deterministically. Defaults to FALSE.
user_points  This option allows you to specify a dataframe, where each row represents an initial cluster center. The user-specified points must have the same number of columns as the training observations. The number of rows must equal the number of clusters.
max_iterations  Maximum training iterations (if estimate_k is enabled, then this is for each inner Lloyds iteration) Defaults to 10.

standardize Logical. Standardize columns before computing distances Defaults to TRUE.

seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

init Initialization mode Must be one of: "Random", "PlusPlus", "Furthest", "User". Defaults to Furthest.

max_runtime_secs Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

categorical_encoding Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

export_checkpoints_dir Automatically export generated models to this directory.

Value

an object of class H2OClusteringModel.

See Also

h2o.cluster_sizes, h2o.totss, h2o.num_iterations, h2o.betweenss, h2o.tot_withinss, h2o.withinss, h2o.centersSTD, h2o.centers

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kmeans(training_frame = prostate, k = 10, x = c("AGE", "RACE", "VOL", "GLEASON"))

## End(Not run)
```

## h2o.kurtosis

Kurtosis of a column

Description

Obtain the kurtosis of a column of a parsed H2O data object.

Usage

h2o.kurtosis(x, ..., na.rm = TRUE)

kurtosis.H2OFrame(x, ..., na.rm = TRUE)
**h2o.levels**

Return the levels from the column requested column.

**Description**

Return the levels from the column requested column.

**Usage**

```
h2o.levels(x, i)
```

**Arguments**

- **x**  
  An H2OFrame object.
- **i**  
  Optional, the index of the column whose domain is to be returned.

**See Also**

`levels` for the base R method.

**Examples**

```r
## Not run:
iris_hf <- as.h2o(iris)
h2o.levels(iris_hf, 5) # returns "setosa" "versicolor" "virginica"
## End(Not run)
```

**Arguments**

- **x**  
  An H2OFrame object.
- **...**  
  Further arguments to be passed from or to other methods.
- **na.rm**  
  A logical value indicating whether NA or missing values should be stripped before the computation.

**Value**

Returns a list containing the kurtosis for each column (NaN for non-numeric columns).

**Examples**

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kurtosis(prostate$AGE)
## End(Not run)
```
**h2o.listTimezones**

*List all of the Time Zones Acceptable by the H2O cluster.*

**Description**

List all of the Time Zones Acceptable by the H2O cluster.

**Usage**

```
h2o.listTimezones()
```

**h2o.list_all_extensions**

*List all H2O registered extensions*

**Description**

List all H2O registered extensions.

**Usage**

```
h2o.list_all_extensions()
```

**h2o.list_api_extensions**

*List registered API extensions*

**Description**

List registered API extensions.

**Usage**

```
h2o.list_api_extensions()
```

**h2o.list_core_extensions**

*List registered core extensions*

**Description**

List registered core extensions.

**Usage**

```
h2o.list_core_extensions()
```
h2o.list_jobs

Return list of jobs performed by the H2O cluster

Description
Return list of jobs performed by the H2O cluster

Usage
h2o.list_jobs()

h2o.loadModel

Load H2O Model from HDFS or Local Disk

Description
Load a saved H2O model from disk. (Note that ensemble binary models can now be loaded using this method.)

Usage
h2o.loadModel(path)

Arguments
path The path of the H2O Model to be imported.

Value
Returns a H2OModel object of the class corresponding to the type of model loaded.

See Also
h2o.saveModel, H2OModel

Examples
## Not run:
# library(h2o)
# h2o.init()
# prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
# prostate = h2o.importFile(path = prostate_path)
# prostate_glm = h2o.glm(y = "CAPSULE", x = c("AGE","RACE","PSA","DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# glmmodel_path = h2o.saveModel(prostate_glm, dir = "/Users/UserName/Desktop"
# glmmodel_load = h2o.loadModel(glmmodel_path)
## End(Not run)
**h2o.log**

*Compute the logarithm of x*

**Description**

Compute the logarithm of x

**Usage**

```
h2o.log(x)
```

**Arguments**

- `x` An H2OFrame object.

**See Also**

`log` for the base R implementation.

---

**h2o.log10**

*Compute the log10 of x*

**Description**

Compute the log10 of x

**Usage**

```
h2o.log10(x)
```

**Arguments**

- `x` An H2OFrame object.

**See Also**

`log10` for the base R implementation.
h2o.log1p

Description
Compute the log1p of x

Usage
h2o.log1p(x)

Arguments
x An H2OFrame object.

See Also
log1p for the base R implementation.

h2o.log2

Description
Compute the log2 of x

Usage
h2o.log2(x)

Arguments
x An H2OFrame object.

See Also
log2 for the base R implementation.
**h2o.logAndEcho**

*Log a message on the server-side logs*

**Description**

This is helpful when running several pieces of work one after the other on a single H2O cluster and you want to make a notation in the H2O server side log where one piece of work ends and the next piece of work begins.

**Usage**

```r
h2o.logAndEcho(message)
```

**Arguments**

- **message**
  
  A character string with the message to write to the log.

**Details**

h2o.logAndEcho sends a message to H2O for logging. Generally used for debugging purposes.

---

**h2o.logloss**

*Retrieve the Log Loss Value*

**Description**

Retrieves the log loss output for a H2OBinomialMetrics or H2OMultinomialMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training Log Loss value is returned. If more than one parameter is set to TRUE, then a named vector of Log Losses are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.logloss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**
  
  A H2OModelMetrics object of the correct type.

- **train**
  
  Retrieve the training Log Loss

- **valid**
  
  Retrieve the validation Log Loss

- **xval**
  
  Retrieve the cross-validation Log Loss
**h2o.ls**

*List Keys on an H2O Cluster*

**Description**

Accesses a list of object keys in the running instance of H2O.

**Usage**

```r
h2o.ls()
```

**Value**

Returns a list of hex keys in the current H2O instance.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()
## End(Not run)
```

**h2o.lstrip**

*Strip set from left*

**Description**

Return a copy of the target column with leading characters removed. The set argument is a string specifying the set of characters to be removed. If omitted, the set argument defaults to removing whitespace.

**Usage**

```r
h2o.lstrip(x, set = " ")
```

**Arguments**

- `x` The column whose strings should be lstrip-ed.
- `set` string of characters to be removed

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_lstrip <- as.h2o("1234567890")
lstrip_string <- h2o.lstrip(string_to_lstrip, "123") #Remove "123"
## End(Not run)
```
h2o.mae

Retrieve the Mean Absolute Error Value

Description

Retrieves the mean absolute error (MAE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training MAE value is returned. If more than one parameter is set to TRUE, then a named vector of MAEs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.mae(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

- object: An H2OModel object.
- train: Retrieve the training MAE
- valid: Retrieve the validation set MAE if a validation set was passed in during model build time.
- xval: Retrieve the cross-validation MAE

Examples

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)

h2o.mae(m)

## End(Not run)
```

h2o.makeGLMModel

Set betas of an existing H2O GLM Model

Description

This function allows setting betas of an existing glm model.

Usage

h2o.makeGLMModel(model, beta)

Arguments

- model: an H2OModel corresponding from a h2o.glm call.
- beta: a new set of betas (a named vector)
h2o.make_metrics

Create Model Metrics from predicted and actual values in H2O

Description

Given predicted values (target for regression, class-1 probabilities or binomial or per-class probabilities for multinomial), compute a model metrics object.

Usage

```r
h2o.make_metrics(predicted, actuals, domain = NULL, distribution = NULL)
```

Arguments

- `predicted` An H2OFrame containing predictions
- `actuals` An H2OFrame containing actual values
- `domain` Vector with response factors for classification.
- `distribution` Distribution for regression.

Value

Returns an object of the H2OModelMetrics subclass.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
pred <- h2o.predict(prostate_gbm, prostate)[,3] # class-1 probability
h2o.make_metrics(pred, prostate$CAPSULE)

## End(Not run)
```

h2o.match

Value Matching in H2O

Description

`match` and `%in%` return values similar to the base R generic functions.

Usage

```r
h2o.match(x, table, nomatch = 0, incomparables = NULL)
matrix.H2OFrame(x, table, nomatch = 0, incomparables = NULL)
x %in% table
```
Arguments

- **x**: A categorical vector from an H2OFrame object with values to be matched.
- **table**: An R object to match x against.
- **nomatch**: The value to be returned in the case when no match is found.
- **incomparables**: A vector of values that cannot be matched. Any value in x matching a value in this vector is assigned the nomatch value.

Value

Returns a vector of the positions of (first) matches of its first argument in its second

See Also

- `match` for base R implementation.

Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
h2o.match(iris_hf[, 5], c("setosa", "versicolor"))
## End(Not run)
```

---

**h2o.max**

*Returns the maxima of the input values.*

Description

Returns the maxima of the input values.

Usage

```r
h2o.max(x, na.rm = FALSE)
```

Arguments

- **x**: An H2OFrame object.
- **na.rm**: Logical, indicating whether missing values should be removed.

See Also

- `max` for the base R implementation.
h2o.mean

Compute the frame’s mean by-column (or by-row).

Description

Compute the frame’s mean by-column (or by-row).

Usage

h2o.mean(x, na.rm = FALSE, axis = 0, return_frame = FALSE, ...)

## S3 method for class 'H2OFrame'
mean(x, na.rm = FALSE, axis = 0,
    return_frame = FALSE, ...)

Arguments

x
An H2OFrame object.

na.rm
logical. Indicate whether missing values should be removed.

axis
integer. Indicate whether to calculate the mean down a column (0) or across a row (1). NOTE: This is only applied when return_frame is set to TRUE. Otherwise, this parameter is ignored.

return_frame
logical. Indicate whether to return an H2O frame or a list. Default is FALSE (returns a list).

...
Further arguments to be passed from or to other methods.

Value

Returns a list containing the mean for each column (NaN for non-numeric columns) if return_frame is set to FALSE. If return_frame is set to TRUE, then it will return an H2O frame with means per column or row (depends on axis argument).

See Also

mean, rowMeans, or colMeans for the base R implementation

Examples

## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Default behavior. Will return list of means per column.
h2o.mean(prostate$AGE)
# return_frame set to TRUE. This will return an H2O Frame
# with mean per row or column (depends on axis argument)
h2o.mean(prostate, na.rm=TRUE, axis=1, return_frame=TRUE)

## End(Not run)
h2o.mean_per_class_error

Retrieve the mean per class error

Description

Retrieves the mean per class error from an H2OBinomialMetrics. If “train”, “valid”, and “xval” parameters are FALSE (default), then the training mean per class error value is returned. If more than one parameter is set to TRUE, then a named vector of mean per class errors are returned, where the names are “train”, “valid” or “xval”.

Usage

h2o.mean_per_class_error(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

  object An H2OBinomialMetrics object.
  train Retrieve the training mean per class error
  valid Retrieve the validation mean per class error
  xval Retrieve the cross-validation mean per class error

See Also

h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mean_per_class_error(perf)
h2o.mean_per_class_error(model, train=TRUE)
## End(Not run)
```
h2o.mean_residual_deviance

Retrieves the Mean Residual Deviance value

Description
Retrieves the Mean Residual Deviance value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training Mean Residual Deviance value is returned. If more than one parameter is set to TRUE, then a named vector of Mean Residual Deviances are returned, where the names are "train", "valid" or "xval".

Usage
h2o.mean_residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OModel object.

train Retrieve the training Mean Residual Deviance

valid Retrieve the validation Mean Residual Deviance

xval Retrieve the cross-validation Mean Residual Deviance

Examples
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)

h2o.mean_residual_deviance(m)
## End(Not run)

h2o.median

H2O Median

Description
Compute the median of an H2OFrame.

Usage
h2o.median(x, na.rm = TRUE)

## S3 method for class 'H2OFrame'
median(x, na.rm = TRUE)
**h2o.melt**

Converts a frame to key-value representation while optionally skipping NA values. Inverse operation to h2o.pivot.

### Description

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame.

### Usage

```r
h2o.melt(x, id_vars, value_vars = NULL, var_name = "variable", value_name = "value", skipna = FALSE)
```

### Arguments

- **x**: an H2OFrame
- **id_vars**: the columns used as identifiers
- **value_vars**: what columns will be converted to key-value pairs (optional, if not specified complement to id_vars will be used)
- **var_name**: name of the key-column (default: "variable")
- **value_name**: name of the value-column (default: "value")
- **skipna**: if enabled, do not include NAs in the result (default: FALSE)

### Value

an unpivoted H2OFrame

---

**Arguments**

- **x**: An H2OFrame object.
- **na.rm**: a logical, indicating whether na’s are omitted.

**Value**

Returns a list containing the median for each column (NaN for non-numeric columns)

**Examples**

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.median(prostate)
## End(Not run)
```
h2o.merge

Merge Two H2O Data Frames

Description

Merges two H2OFrame objects with the same arguments and meanings as merge() in base R. However, we do not support all=TRUE, all.x=TRUE and all.y=TRUE. The default method is auto and it will default to the radix method. The radix method will return the correct merge result regardless of duplicated rows in the right frame. In addition, the radix method can perform merge even if you have string columns in your frames. If there are duplicated rows in your right frame, they will not be included if you use the hash method. The hash method cannot perform merge if you have string columns in your left frame. Hence, we consider the radix method superior to the hash method and is the default method to use.

Usage

```r
h2o.merge(x, y, by = intersect(names(x), names(y)), by.x = by,
by.y = by, all = FALSE, all.x = all, all.y = all,
method = "auto")
```

Arguments

- `x, y`: H2OFrame objects
- `by`: columns used for merging by default the common names
- `by.x`: x columns used for merging by name or number
- `by.y`: y columns used for merging by name or number
- `all`: TRUE includes all rows in x and all rows in y even if there is no match to the other
- `all.x`: If all.x is true, all rows in the x will be included, even if there is no matching row in y, and vice-versa for all.y.
- `all.y`: see all.x
- `method`: auto(default), radix, hash

Examples

```r
## Not run:
h2o.init()
left <- data.frame(fruit = c("apple", "orange", "banana", "lemon", "strawberry", "blueberry"),
color <- c("red", "orange", "yellow", "yellow", "red", "blue"))
right <- data.frame(fruit = c("apple", "orange", "banana", "lemon", "strawberry", "watermelon"),
citrus <- c(FALSE, TRUE, FALSE, TRUE, FALSE, FALSE))
left_hf <- as.h2o(left)
right_hf <- as.h2o(right)
merged <- h2o.merge(left_hf, right_hf, all.x = TRUE)
## End(Not run)
```
H2O Model Metric Accessor Functions

Description

A series of functions that retrieve model metric details.

Usage

h2o.metric(object, thresholds, metric, transform = NULL)

h2o.F0point5(object, thresholds)

h2o.F1(object, thresholds)

h2o.F2(object, thresholds)

h2o.accuracy(object, thresholds)

h2o.error(object, thresholds)

h2o.maxPerClassError(object, thresholds)

h2o.mean_per_class_accuracy(object, thresholds)

h2o.mcc(object, thresholds)

h2o.precision(object, thresholds)

h2o.tpr(object, thresholds)

h2o.fpr(object, thresholds)

h2o.fnr(object, thresholds)

h2o.tnr(object, thresholds)

h2o.recall(object, thresholds)

h2o.sensitivity(object, thresholds)

h2o.fallout(object, thresholds)

h2o.missrate(object, thresholds)

h2o.specificity(object, thresholds)

Arguments

object An H2OModelMetrics object of the correct type.
h2o.min

thresholds (Optional) A value or a list of values between 0.0 and 1.0. If not set, then all thresholds will be returned. If "max", then the threshold maximizing the metric will be used.

metric (Optional) the metric to retrieve. If not set, then all metrics will be returned.

transform (Optional) a list describing a transformer for the given metric, if any. e.g. transform=list(op=foo_fn, name="foo") will rename the given metric to "foo" and apply function foo_fn to the metric values.

Details

Many of these functions have an optional thresholds parameter. Currently only increments of 0.1 are allowed. If not specified, the functions will return all possible values. Otherwise, the function will return the value for the indicated threshold.

Currently, the these functions are only supported by H2OBinomialMetrics objects.

Value

Returns either a single value, or a list of values.

See Also

h2o.auc for AUC, h2o.giniCoef for the GINI coefficient, and h2o.mse for MSE. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate$CAPSULE <- as.factor(prostate$CAPSULE)
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.F1(perf)

## End(Not run)
Arguments

x  An H2OFrame object.
na.rm  logical. indicating whether missing values should be removed.

See Also

`min` for the base R implementation.

---

**h2o.mktime**  *Compute msec since the Unix Epoch*

**Description**

Compute msec since the Unix Epoch

**Usage**

```r
h2o.mktime(year = 1970, month = 0, day = 0, hour = 0, minute = 0,
           second = 0, msec = 0)
```

**Arguments**

- `year`  Defaults to 1970
- `month`  zero based (months are 0 to 11)
- `day`  zero based (days are 0 to 30)
- `hour`  hour
- `minute`  minute
- `second`  second
- `msec`  msec

---

**h2o.mojo_predict_csv**  *H2O Prediction from R without having H2O running*

**Description**

Provides the method `h2o.mojo_predict_csv` with which you can predict a MOJO model from R.

**Usage**

```r
h2o.mojo_predict_csv(input_csv_path, mojo_zip_path,
                      output_csv_path = NULL, genmodel_jar_path = NULL, classpath = NULL,
                      java_options = NULL, verbose = F, setInvNumNA = F)
```
Arguments

- **input_csv_path**: Path to input CSV file.
- **mojo_zip_path**: Path to MOJO zip downloaded from H2O.
- **output_csv_path**: Optional, path to the output CSV file with computed predictions. If NULL (default), then predictions will be saved as prediction.csv in the same folder as the MOJO zip.
- **genmodel_jar_path**: Optional, path to genmodel jar file. If NULL (default) then the h2o-genmodel.jar in the same folder as the MOJO zip will be used.
- **classpath**: Optional, specifies custom user defined classpath which will be used when scoring. If NULL (default) then the default classpath for this MOJO model will be used.
- **java_options**: Optional, custom user defined options for Java. By default `-Xmx4g -XX:ReservedCodeCacheSize=256m` is used.
- **verbose**: Optional, if TRUE, then additional debug information will be printed. FALSE by default.
- **setInvNumNA**: Optional, if TRUE, then for an string that cannot be parsed into a number an N/A value will be produced, if false the command will fail. FALSE by default.

Value

Returns a data.frame containing computed predictions

---

**h2o.mojo_predict_df**  
*H2O Prediction from R without having H2O running*

Description

Provides the method h2o.mojo_predict_df with which you can predict a MOJO model from R.

Usage

```r
h2o.mojo_predict_df(frame, mojo_zip_path, genmodel_jar_path = NULL, 
classpath = NULL, java_options = NULL, verbose = F, 
setInvNumNA = F)
```

Arguments

- **frame**: data.frame to score.
- **mojo_zip_path**: Path to MOJO zip downloaded from H2O.
- **genmodel_jar_path**: Optional, path to genmodel jar file. If NULL (default) then the h2o-genmodel.jar in the same folder as the MOJO zip will be used.
- **classpath**: Optional, specifies custom user defined classpath which will be used when scoring. If NULL (default) then the default classpath for this MOJO model will be used.
Java options: Optional, custom user defined options for Java. By default `-Xmx4g -XX:ReservedCodeCacheSize=256m` is used.

Verbose: Optional, if TRUE, then additional debug information will be printed. FALSE by default.

SetInvNumNA: Optional, if TRUE, then for an string that cannot be parsed into a number an N/A value will be produced, if false the command will fail. FALSE by default.

Value

Returns a data.frame containing computed predictions

---

### h2o.month

**Convert Milliseconds to Months in H2O Datasets**

**Description**

Converts the entries of an H2OFrame object from milliseconds to months (on a 1 to 12 scale).

**Usage**

```r
h2o.month(x)
```

```r
month(x)
```

```r
## S3 method for class 'H2OFrame'
month(x)
```

**Arguments**

`x` An H2OFrame object.

**Value**

An H2OFrame object containing the entries of `x` converted to months of the year.

**See Also**

`h2o.year`
h2o.mse

Retrieves Mean Squared Error Value

Description
Retrieves the mean squared error value from an \texttt{H2OModelMetrics} object. If "train", "valid", and "xval" parameters are FALSE (default), then the training MSE value is returned. If more than one parameter is set to TRUE, then a named vector of MSEs are returned, where the names are "train", "valid" or "xval".

Usage
\[ \texttt{h2o.mse(object, train = FALSE, valid = FALSE, xval = FALSE)} \]

Arguments
\begin{description}
\item[object] An \texttt{H2OModelMetrics} object of the correct type.
\item[train] Retrieve the training MSE
\item[valid] Retrieve the validation MSE
\item[xval] Retrieve the cross-validation MSE
\end{description}

Details
This function only supports \texttt{H2OBinomialMetrics}, \texttt{H2OMultinomialMetrics}, and \texttt{H2ORegressionMetrics} objects.

See Also
\texttt{h2o.auc} for AUC, \texttt{h2o.mse} for MSE, and \texttt{h2o.metric} for the various threshold metrics. See \texttt{h2o.performance} for creating \texttt{H2OModelMetrics} objects.

Examples
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mse(perf)
## End(Not run)
h2o.nacnt

Count of NAs per column

Description
Gives the count of NAs per column.

Usage
h2o.nacnt(x)

Arguments
x An H2OFrame object.

Value
Returns a list containing the count of NAs per column

Examples
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
h2o.nacnt(iris_hf) # should return all 0s
h2o.insertMissingValues(iris_hf)
h2o.nacnt(iris_hf)
## End(Not run)

h2o.naiveBayes

Compute naive Bayes probabilities on an H2O dataset.

Description
The naive Bayes classifier assumes independence between predictor variables conditional on the response, and a Gaussian distribution of numeric predictors with mean and standard deviation computed from the training dataset. When building a naive Bayes classifier, every row in the training dataset that contains at least one NA will be skipped completely. If the test dataset has missing values, then those predictors are omitted in the probability calculation during prediction.

Usage
h2o.naiveBayes(x, y, training_frame, model_id = NULL, nfolds = 0,
seed = -1, fold_assignment = c("AUTO", "Random", "Modulo",
"Stratified"), fold_column = NULL,
keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
keep_cross_validation_fold_assignment = FALSE,
validation_frame = NULL, ignore_const_cols = TRUE,
score_each_iteration = FALSE, balance_classes = FALSE,
class_sampling_factors = NULL, max_after_balance_size = 5,
max_hit_ratio_k = 0, laplace = 0, threshold = 0.001,
min_sdev = 0.001, eps = 0, eps_sdev = 0, min_prob = 0.001,
eps_prob = 0, compute_metrics = TRUE, max_runtime_secs = 0,
export_checkpoints_dir = NULL)

Arguments

x  (Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.
y  The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-
fication model.
training_frame  Id of the training data frame.
model_id  Destination id for this model; auto-generated if not specified.
nfolds  Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to
0.
seed  Seed for random numbers (affects certain parts of the algo that are stochastic
and those might or might not be enabled by default). Defaults to -1 (time-based
random number).
fold_assignment  Cross-validation fold assignment scheme, if fold_column is not specified. The
'Stratified' option will stratify the folds based on the response variable, for clas-
sification problems. Must be one of: "AUTO", "Random", "Modulo", "Strati-
fi ed". Defaults to AUTO.
fold_column  Column with cross-validation fold index assignment per observation.
keep_cross_validation_models  Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions  Logical. Whether to keep the predictions of the cross-validation models. De-
faults to FALSE.
keep_cross_validation_fold_assignment  Logical. Whether to keep the cross-validation fold assignment. Defaults to
FALSE.
validation_frame  Id of the validation data frame.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to
FALSE.
balance_classes  Logical. Balance training data class counts via over/under-sampling (for im-
balanced data). Defaults to FALSE.
class_sampling_factors  Desired over/under-sampling ratios per class (in lexicographic order). If not
specified, sampling factors will be automatically computed to obtain class bal-
ance during training. Requires balance_classes.
max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be
less than 1.0). Requires balance_classes. Defaults to 5.0.

max_hit_ratio_k
Max. number (top K) of predictions to use for hit ratio computation (for multi-
class only, 0 to disable) Defaults to 0.

laplace
Laplace smoothing parameter Defaults to 0.

threshold
This argument is deprecated, use ‘min_sdev’ instead. The minimum standard
deviation to use for observations without enough data. Must be at least 1e-10.

min_sdev
The minimum standard deviation to use for observations without enough data.
Must be at least 1e-10.

eps
This argument is deprecated, use ‘eps_sdev’ instead. A threshold cutoff to deal
with numeric instability, must be positive.

eps_sdev
A threshold cutoff to deal with numeric instability, must be positive.

min_prob
Min. probability to use for observations with not enough data.

eps_prob
Cutoff below which probability is replaced with min_prob.

compute_metrics
Logical. Compute metrics on training data Defaults to TRUE.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable.
Defaults to 0.

export_checkpoints_dir
Automatically export generated models to this directory.

Value

an object of class `H2OBinomialModel` if the response has two categorical levels, and `H2OMultinomialModel`
otherwise.

Examples

```r
## Not run:
h2o.init()
votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
votes <- h2o.uploadFile(path = votes_path, header = TRUE)
h2o.naiveBayes(x = 2:17, y = 1, training_frame = votes, laplace = 3)

## End(Not run)
```

---

**h2o.names**

*Column names of an H2OFrame*

**Description**

Column names of an H2OFrame

**Usage**

```r
h2o.names(x)
```
h2o.na_omit

Arguments

x  An H2OFrame object.

See Also

names for the base R implementation.

h2o.na_omit  Remove Rows With NAs

Description

Remove Rows With NAs

Usage

h2o.na_omit(object, ...)

Arguments

object  H2OFrame object
...
...  Ignored

Value

Returns an H2OFrame object containing non-NA rows.

h2o.nchar  String length

Description

String length

Usage

h2o.nchar(x)

Arguments

x  The column whose string lengths will be returned.

Examples

## Not run:
library(h2o)
h2o.init()
string_to_nchar <- as.h2o("r tutorial")
nchar_string <- h2o.nchar(string_to_nchar)

## End(Not run)
h2o.nlevels

Description
Return the number of factor levels for this frame.

Usage
h2o.nlevels(x)

Arguments
x An H2OFrame object.

See Also
nlevels for the base R method.

h2o.networkTest

Description
View Network Traffic Speed

Usage
h2o.networkTest()

Value
Returns a table listing the network speed for 1B, 10KB, and 10MB.

h2o.ncol

Description
Return the number of columns present in x.

Usage
h2o.ncol(x)

Arguments
x An H2OFrame object.

See Also
ncol for the base R implementation.
**h2o.no_progress**

*Disable Progress Bar*

**Description**

Disable Progress Bar

**Usage**

```r
h2o.no_progress()
```

**h2o.nrow**

*Return the number of rows present in x.*

**Description**

Return the number of rows present in x.

**Usage**

```r
h2o.nrow(x)
```

**Arguments**

- `x` An H2OFrame object.

**See Also**

`nrow` for the base R implementation.

**h2o.null_deviance**

*Retrieve the null deviance*

**Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training null deviance value is returned. If more than one parameter is set to TRUE, then a named vector of null deviances are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.null_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- `object` An H2OModel or H2OModelMetrics
- `train` Retrieve the training null deviance
- `valid` Retrieve the validation null deviance
- `xval` Retrieve the cross-validation null deviance
h2o.null_dof

Retrieve the null degrees of freedom

Description
If "train", "valid", and "xval" parameters are FALSE (default), then the training null degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of null degrees of freedom are returned, where the names are "train", "valid" or "xval".

Usage
h2o.null_dof(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments
- object: An H2OModel or H2OModelMetrics
- train: Retrieve the training null degrees of freedom
- valid: Retrieve the validation null degrees of freedom
- xval: Retrieve the cross-validation null degrees of freedom

h2o.num_iterations

Retrieve the number of iterations.

Description
Retrieve the number of iterations.

Usage
h2o.num_iterations(object)

Arguments
- object: An H2OClusteringModel object.
- ... further arguments to be passed on (currently unimplemented)
**h2o.num_valid_substrings**

*Count of substrings >= 2 chars that are contained in file*

**Description**

Find the count of all possible substrings >= 2 chars that are contained in the specified line-separated text file.

**Usage**

```r
h2o.num_valid_substrings(x, path)
```

**Arguments**

- `x` The column on which to calculate the number of valid substrings.
- `path` Path to text file containing line-separated strings to be referenced.

**h2o.openLog**

*View H2O R Logs*

**Description**

Open existing logs of H2O R POST commands and error responses on local disk. Used primarily for debugging purposes.

**Usage**

```r
h2o.openLog(type)
```

**Arguments**

- `type` Currently unimplemented.

**See Also**

- `h2o.startLogging`, `h2o.stopLogging`, `h2o.clearLog`

**Examples**

```r
## Not run:
h2o.init()

h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()

# Not run to avoid windows being opened during R CMD check
# h2o.openLog("Command")
# h2o.openLog("Error")

## End(Not run)
```
Description
The second phase in the data ingestion step.

Usage
```r
h2o.parseRaw(data, pattern = "", destination_frame = "", header = NA, 
  sep = "", col.names = NULL, col.types = NULL, na.strings = NULL, 
  blocking = FALSE, parse_type = NULL, chunk_size = NULL, 
  decrypt_tool = NULL, skipped_columns = NULL, 
  custom_non_data_line_markers = NULL)
```

Arguments
- **data**: An H2OFrame object to be parsed.
- **pattern**: (Optional) Character string containing a regular expression to match file(s) in the folder.
- **destination_frame**: (Optional) The hex key assigned to the parsed file.
- **header**: (Optional) A logical value indicating whether the first row is the column header. If missing, H2O will automatically try to detect the presence of a header.
- **sep**: (Optional) The field separator character. Values on each line of the file are separated by this character. If `sep = ""`, the parser will automatically detect the separator.
- **col.names**: (Optional) An H2OFrame object containing a single delimited line with the column names for the file. If skipped_columns are specified, only list column names of columns that are not skipped.
- **col.types**: (Optional) A vector specifying the types to attempt to force over columns. If skipped_columns are specified, only list column types of columns that are not skipped.
- **na.strings**: (Optional) H2O will interpret these strings as missing.
- **blocking**: (Optional) Tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.
- **parse_type**: (Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"
- **chunk_size**: size of chunk of (input) data in bytes
- **decrypt_tool**: (Optional) Specify a Decryption Tool (key-reference acquired by calling `h2o.decryptionSetup`).
- **skipped_columns**: a list of column indices to be excluded from parsing
- **custom_non_data_line_markers**: (Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used
h2o.parseSetup

Details

Parse the Raw Data produced by the import phase.

See Also

h2o.importFile, h2o.parseSetup

h2o.parseSetup

Get a parse setup back for the staged data.

Description

Get a parse setup back for the staged data.

Usage

h2o.parseSetup(data, pattern = "", destination_frame = "", header = NA, sep = "", col.names = NULL, col.types = NULL, na.strings = NULL, parse_type = NULL, chunk_size = NULL, decrypt_tool = NULL, skipped_columns = NULL, custom_non_data_line_markers = NULL)

Arguments

data
(pattern) Character string containing a regular expression to match file(s) in the folder.

destination_frame
(Optional) The hex key assigned to the parsed file.

header
(Optional) A logical value indicating whether the first row is the column header. If missing, H2O will automatically try to detect the presence of a header.

sep
(Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.

col.names
(Optional) An H2OFrame object containing a single delimited line with the column names for the file. If skipped_columns are specified, only list column names of columns that are not skipped.

col.types
(Optional) A vector specifying the types to attempt to force over columns. If skipped_columns are specified, only list column types of columns that are not skipped.

na.strings
(Optional) H2O will interpret these strings as missing.

parse_type
(Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"

chunk_size
size of chunk of (input) data in bytes

decrypt_tool
(Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup).

skipped_columns
a list of column indices to be excluded from parsing

custom_non_data_line_markers
(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used
h2o.partialPlot

Partial Dependence Plots

Description

Partial dependence plot gives a graphical depiction of the marginal effect of a variable on the response. The effect of a variable is measured in change in the mean response. Note: Unlike randomForest's partialPlot when plotting partial dependence the mean response (probabilities) is returned rather than the mean of the log class probability.

Usage

h2o.partialPlot(object, data, cols, destination_key, nbins = 20, plot = TRUE, plot_stddev = TRUE, weight_column = -1, include_na = FALSE, user_splits = NULL, col_pairs_2dpdp = NULL, save_to = NULL, row_index = -1)

Arguments

object An H2OModel object.
data An H2OFrame object used for scoring and constructing the plot.
cols Feature(s) for which partial dependence will be calculated.
destination_key An key reference to the created partial dependence tables in H2O.
nbins Number of bins used. For categorical columns make sure the number of bins exceeds the level count. If you enable add_missing_NA, the returned length will be nbins+1.
plot A logical specifying whether to plot partial dependence table.
plot_stddev A logical specifying whether to add std err to partial dependence plot.
weight_column A string denoting which column of data should be used as the weight column.
include_na A logical specifying whether missing value should be included in the Feature values.
user_splits A two-level nested list containing user defined split points for pdp plots for each column. If there are two columns using user defined split points, there should be two lists in the nested list. Inside each list, the first element is the column name followed by values defined by the user.

col_pairs_2dpdp A two-level nested list like this: col_pairs_2dpdp = list(c("col1_name", "col2_name"), c("col1_name", "col3_name"), ...), where a 2D partial plots will be generated for col1_name, col2_name pair, for col1_name, col3_name pair and whatever other pairs that are specified in the nested list.

save_to Fully qualified prefix of the image files the resulting plots should be saved to, e.g. '/home/user/pdp'. Plots for each feature are saved separately in PNG format, each file receives a suffix equal to the corresponding feature name, e.g. '/home/user/pdp_AGE.png'. If the files already exists, they will be overridden. Files are only saves if plot = TRUE (default).

See Also

h2o.parseRaw
**row_index**

Row for which partial dependence will be calculated instead of the whole input frame.

**Value**

Plot and list of calculated mean response tables for each feature requested.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, "CAPSULE"] <- as.factor(prostate[, "CAPSULE"] )
prostate[, "RACE"] <- as.factor(prostate[,"RACE"] )
prostate_gbm <- h2o.gbm(x = c("AGE","RACE"),
                        y = "CAPSULE",
                        training_frame = prostate,
                        ntrees = 10,
                        max_depth = 5,
                        learn_rate = 0.1)
h2o.partialPlot(object = prostate_gbm, data = prostate, cols = c("AGE", "RACE"))
## End(Not run)
```

---

**h2o.performance**  
*Model Performance Metrics in H2O*

**Description**

Given a trained h2o model, compute its performance on the given dataset. However, if the dataset does not contain the response/target column, no performance will be returned. Instead, a warning message will be printed.

**Usage**

```r
h2o.performance(model, newdata = NULL, train = FALSE, valid = FALSE, xval = FALSE, data = NULL)
```

**Arguments**

- `model`: An H2OModel object
- `newdata`: An H2OFrame. The model will make predictions on this dataset, and subsequently score them. The dataset should match the dataset that was used to train the model, in terms of column names, types, and dimensions. If newdata is passed in, then train, valid, and xval are ignored.
- `train`: A logical value indicating whether to return the training metrics (constructed during training).
  
  Note: when the trained h2o model uses balance_classes, the training metrics constructed during training will be from the balanced training dataset. For more information visit: [https://0xdata.atlassian.net/browse/TN-9](https://0xdata.atlassian.net/browse/TN-9)
valid A logical value indicating whether to return the validation metrics (constructed during training).

xval A logical value indicating whether to return the cross-validation metrics (constructed during training).

data (DEPRECATED) An H2OFrame. This argument is now called 'newdata'.

Value

Returns an object of the H2OModelMetrics subclass.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.performance(model = prostate_gbm, newdata=prostate)

## If model uses balance_classes
## the results from train = TRUE will not match the results from newdata = prostate.hex
prostate_gbm_balanced <- h2o.gbm(3:9, "CAPSULE", prostate, balance_classes = TRUE)
h2o.performance(model = prostate_gbm_balanced, newdata = prostate)
h2o.performance(model = prostate_gbm_balanced, train = TRUE)

## End(Not run)

h2o.pivot

Pivot a frame

Description

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame.

Usage

h2o.pivot(x, index, column, value)

Arguments

x an H2OFrame

index the column where pivoted rows should be aligned on

column the column to pivot

value values of the pivoted table

Value

An H2OFrame with columns from the columns arg, aligned on the index arg, with values from values arg.
h2o.prcomp

Principal component analysis of an H2O data frame

Description

Principal components analysis of an H2O data frame using the power method to calculate the singular value decomposition of the Gram matrix.

Usage

h2o.prcomp(training_frame, x, model_id = NULL, validation_frame = NULL, ignore_const_cols = TRUE, score_each_iteration = FALSE, transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"), pca_method = c("GramSVD", "Power", "Randomized", "GLRM"), pca_impl = c("MTJ_EVD_DENSEMATRIX", "MTJ_EVD_SYMMATRIX", "MTJ_SVD_DENSEMATRIX", "JAMA"), k = 1, max_iterations = 1000, use_all_factor_levels = FALSE, compute_metrics = TRUE, impute_missing = FALSE, seed = -1, max_runtime_secs = 0, export_checkpoints_dir = NULL)

Arguments

training_frame  Id of the training data frame.
x  A vector containing the character names of the predictors in the model.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
transform  Transformation of training data Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.
pca_method  Specify the algorithm to use for computing the principal components: GramSVD - uses a distributed computation of the Gram matrix, followed by a local SVD; Power - computes the SVD using the power iteration method (experimental); Randomized - uses randomized subspace iteration method; GLRM - fits a generalized low-rank model with L2 loss function and no regularization and solves for the SVD using local matrix algebra (experimental) Must be one of: "GramSVD", "Power", "Randomized", "GLRM". Defaults to GramSVD.
h2o.predict

Predict on an H2O Model

Description

Predict on an H2O Model

k
  Rank of matrix approximation Defaults to 1.

max_iterations
  Maximum training iterations Defaults to 1000.

use_all_factor_levels
  Logical. Whether first factor level is included in each categorical expansion
  Defaults to FALSE.

compute_metrics
  Logical. Whether to compute metrics on the training data Defaults to TRUE.

impute_missing
  Logical. Whether to impute missing entries with the column mean Defaults to FALSE.

seed
  Seed for random numbers (affects certain parts of the algo that are stochastic
  and those might or might not be enabled by default). Defaults to -1 (time-based
  random number).

max_runtime_secs
  Maximum allowed runtime in seconds for model training. Use 0 to disable.
  Defaults to 0.

export_checkpoints_dir
  Automatically export generated models to this directory.

Value

an object of class H2ODimReductionModel.

Examples

```r
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.prcomp(training_frame = australia, k = 8, transform = "STANDARDIZE")

## End(Not run)
```

h2o.predict

Predict on an H2O Model
Usage

h2o.predict(object, newdata, ...)

Arguments

object a fitted model object for which prediction is desired.
newdata An H2OFrame object in which to look for variables with which to predict.
... additional arguments to pass on.

Value

Returns an H2OFrame object with probabilities and default predictions.

h2o.predict_json

H2O Prediction from R without having H2O running

Description

Provides the method h2o.predict with which you can predict a MOJO or POJO Jar model from R.

Usage

h2o.predict_json(model, json, genmodelpath, labels, classpath, javaoptions)

Arguments

model String with file name of MOJO or POJO Jar
json JSON String with inputs to model
genmodelpath (Optional) path name to h2o-genmodel.jar, if not set defaults to same dir as MOJO
labels (Optional) if TRUE then show output labels in result
classpath (Optional) Extra items for the class path of where to look for Java classes, e.g., h2o-genmodel.jar
javaoptions (Optional) Java options string. default if "-Xmx4g"

Value

Returns an object with the prediction result

Examples

## Not run:
library(h2o)
h2o.predict_json("~/GBM_model_python_1473313897851_6.zip", "{C7":1}")
h2o.predict_json("~/GBM_model_python_1473313897851_6.zip", "{C7":1}", c(".", "lib"))

## End(Not run)
h2o.print  

Print An H2OFrame

Description

Print An H2OFrame

Usage

h2o.print(x, n = 6L)

Arguments

x  
An H2OFrame object

n  
An (Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).

...  
Further arguments to be passed from or to other methods.

h2o.prod  

Return the product of all the values present in its arguments.

Description

Return the product of all the values present in its arguments.

Usage

h2o.prod(x)

Arguments

x  
An H2OFrame object.

See Also

prod for the base R implementation.
**h2o.proj_archetypes**  
*Convert Archetypes to Features from H2O GLRM Model*

**Description**

Project each archetype in an H2O GLRM model into the corresponding feature space from the H2O training frame.

**Usage**

```r
h2o.proj_archetypes(object, data, reverse_transform = FALSE)
```

**Arguments**

- `object` An `H2ODimReductionModel` object that represents the model containing archetypes to be projected.
- `data` An `H2OFrame` object representing the training data for the H2O GLRM model.
- `reverse_transform` (Optional) A logical value indicating whether to reverse the transformation from model-building by re-scaling columns and adding back the offset to each column of the projected archetypes.

**Value**

Returns an `H2OFrame` object containing the projection of the archetypes down into the original feature space, where each row is one archetype.

**See Also**

- `h2o.glrm` for making an `H2ODimReductionModel`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_glrm <- h2o.glrm(training_frame = iris_hf, k = 4, loss = "Quadratic",
                      multi_loss = "Categorical", max_iterations = 1000)
iris_parch <- h2o.proj_archetypes(iris_glrm, iris_hf)
head(iris_parch)
## End(Not run)
```
Description

Retrieves the pr_auc value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training pr_auc value is returned. If more than one parameter is set to TRUE, then a named vector of pr_aucs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.pr_auc(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object
  An H2OBinomialMetrics object.
train
  Retrieve the training pr_auc
valid
  Retrieve the validation pr_auc
xval
  Retrieve the cross-validation pr_auc

See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.pr_auc(perf)

## End(Not run)
Usage

h2o.psvm(x, y, training_frame, model_id = NULL,
    validation_frame = NULL, ignore_const_cols = TRUE, hyper_param = 1,
    kernel_type = c("gaussian"), gamma = -1, rank_ratio = -1,
    positive_weight = 1, negative_weight = 1,
    disable_training_metrics = TRUE, sv_threshold = 1e-04,
    fact_threshold = 1e-05, feasible_threshold = 0.001,
    surrogate_gap_threshold = 0.001, mu_factor = 10,
    max_iterations = 200, seed = -1)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.
y The name or column index of the response variable in the data. The response must be either a binary categorical/factor variable or a numeric variable with values -1/1 (for compatibility with SVMlight format).
training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
ignore_const_cols Logical. Ignore constant columns. Defaults to TRUE.
hyper_param Penalty parameter C of the error term Defaults to 1.
kernel_type Type of used kernel Must be one of: "gaussian". Defaults to gaussian.
gamma Coefficient of the kernel (currently RBF gamma for gaussian kernel, -1 means 1/#features) Defaults to -1.
rank_ratio Desired rank of the ICF matrix expressed as an ration of number of input rows (-1 means use sqrt(#rows)). Defaults to -1.
positive_weight Weight of positive (+1) class of observations Defaults to 1.
negative_weight Weight of positive (-1) class of observations Defaults to 1.
disable_training_metrics Logical. Disable calculating training metrics (expensive on large datasets) Defaults to TRUE.
sv_threshold Threshold for accepting a candidate observation into the set of support vectors Defaults to 0.0001.
fact_threshold Convergence threshold of the Incomplete Cholesky Factorization (ICF) Defaults to 1e-05.
feasible_threshold Convergence threshold for primal-dual residuals in the IPM iteration Defaults to 0.001.
surrogate_gap_threshold Feasibility criterion of the surrogate duality gap (eta) Defaults to 0.001.
mu_factor Increasing factor mu Defaults to 10.
max_iterations Maximum number of iteration of the algorithm Defaults to 200.
seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
h2o.quantile

Quantiles of H2O Frames.

Description
Obtain and display quantiles for H2O parsed data.

Usage

h2o.quantile(x, probs = c(0.001, 0.01, 0.1, 0.25, 0.333, 0.5, 0.667, 0.75, 0.9, 0.99, 0.999), combine_method = c("interpolate", "average", "avg", "low", "high"), weights_column = NULL, ...)

Arguments

x         An H2OFrame object with a single numeric column.
probs     Numeric vector of probabilities with values in [0,1].
combine_method How to combine quantiles for even sample sizes. Default is to do linear interpolation. E.g., If method is "lo", then it will take the lo value of the quantile. Abbreviations for average, low, and high are acceptable (avg, lo, hi).
weights_column (Optional) String name of the observation weights column in x or an H2OFrame object with a single numeric column of observation weights.
...
Further arguments passed to or from other methods.

Details

Value
A vector describing the percentiles at the given cutoffs for the H2OFrame object.

Examples

## Not run:
# Request quantiles for an H2O parsed data set:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Request quantiles for a subset of columns in an H2O parsed data set
quantile(prostate[,3])
for(i in 1:ncol(prostate))
  quantile(prostate[, i])

## End(Not run)
h2o.r2  

Retrieves the R2 value

Description

Retrieves the R2 value from an H2O model. Will return $R^2$ for GLM Models and will return NaN otherwise. If "train", "valid", and "xval" parameters are FALSE (default), then the training R2 value is returned. If more than one parameter is set to TRUE, then a named vector of R2s are returned, where the names are "train", "valid" or "xval".

Usage

h2o.r2(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object  
An H2OModel object.

train  
Retrieve the training R2

valid  
Retrieve the validation set R2 if a validation set was passed in during model build time.

xval  
Retrieve the cross-validation R2

Examples

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.glm(x = 2:5, y = 1, training_frame = fr)
h2o.r2(m)

## End(Not run)
```

h2o.randomForest  

Build a Random Forest model

Description

Builds a Random Forest model on an H2OFrame.
Usage

h2o.randomForest(x, y, training_frame, model_id = NULL,
validation_frame = NULL, nfolds = 0,
keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
keep_cross_validation_fold_assignment = FALSE,
score_each_iteration = FALSE, score_tree_interval = 0,
fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
fold_column = NULL, ignore_const_cols = TRUE, offset_column = NULL,
weights_column = NULL, balance_classes = FALSE,
class_sampling_factors = NULL, max_after_balance_size = 5,
max_hit_ratio_k = 0, ntrees = 50, max_depth = 20, min_rows = 1,
 nbins = 20, nbins_top_level = 1024, nbins_cats = 1024,
r2_stopping = Inf, stopping_rounds = 0, stopping_metric = c("AUTO",
"deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC",
"lift_top_group", "misclassification", "AUCPR", "mean_per_class_error",
"custom", "custom_increasing"), stopping_tolerance = 0.001,
max_runtime_secs = 0, seed = -1, build_tree_one_node = FALSE,
mtries = -1, sample_rate = 0.632, sample_rate_per_class = NULL,
binomial_double_trees = FALSE, checkpoint = NULL,
col_sample_rate_change_per_level = 1, col_sample_rate_per_tree = 1,
min_split_improvement = 1e-05, histogram_type = c("AUTO",
"UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin"),
categorical_encoding = c("AUTO", "Enum", "OneHotInternal",
"OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse",
"EnumLimited"), calibrate_model = FALSE, calibration_frame = NULL,
distribution = c("AUTO", "bernoulli", "multinomial", "gaussian",
"poisson", "gamma", "tweedie", "laplace", "quantile", "huber"),
custom_metric_func = NULL, export_checkpoints_dir = NULL,
check_constant_response = TRUE, verbose = FALSE)

Arguments

x
(Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.

y
The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-

cification model.

training_frame
Id of the training data frame.

model_id
Destination id for this model; auto-generated if not specified.

validation_frame
Id of the validation data frame.

nfolds
Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to
0.

keep_cross_validation_models
Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep_cross_validation_predictions
Logical. Whether to keep the predictions of the cross-validation models. De-
faults to FALSE.
keep_cross_validation_fold_assignment
Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

score_each_iteration
Logical. Whether to score during each iteration of model training. Defaults to FALSE.

score_tree_interval
Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

fold_assignment
Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column
Column with cross-validation fold index assignment per observation.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

offset_column
Offset column. This argument is deprecated and has no use for Random Forest.

weights_column
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_hit_ratio_k
Max. number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable) Defaults to 0.

ntrees
Number of trees. Defaults to 50.

max_depth
Maximum tree depth. Defaults to 20.

min_rows
Fewest allowed (weighted) observations in a leaf. Defaults to 1.

nbins
For numerical columns (real/int), build a histogram of (at least) this many bins, then split at the best point Defaults to 20.

nbins_top_level
For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level Defaults to 1024.

nbins_cats
For categorical columns (factors), build a histogram of this many bins, then split at the best point. Higher values can lead to more overfitting. Defaults to 1024.
r2_stopping  r2_stopping is no longer supported and will be ignored if set - please use stopping_rounds, stopping_metric and stopping_tolerance instead. Previous version of H2O would stop making trees when the R^2 metric equals or exceeds this Defaults to 1.797693135e+308.

stopping_rounds  Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric  Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance  Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max_runtime_secs  Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

build_tree_one_node  Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries  Number of variables randomly sampled as candidates at each split. If set to -1, defaults to sqrt(p) for classification and p/3 for regression (where p is the # of predictors Defaults to -1.

sample_rate  Row sample rate per tree (from 0.0 to 1.0) Defaults to 0.632.

sample_rate_per_class  A list of row sample rates per class (relative fraction for each class, from 0.0 to 1.0), for each tree

binomial_double_trees  Logical. For binary classification: Build 2x as many trees (one per class) - can lead to higher accuracy. Defaults to FALSE.

checkpoint  Model checkpoint to resume training with.

col_sample_rate_change_per_level  Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col_sample_rate_per_tree  Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

min_split_improvement  Minimum relative improvement in squared error reduction for a split to happen Defaults to 1e-05.

histogram_type  What type of histogram to use for finding optimal split points Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.
categorical_encoding
  Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

calibrate_model
  Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration_frame
  Calibration frame for Platt Scaling
distribution
  Distribution. This argument is deprecated and has no use for Random Forest.
custom_metric_func
  Reference to custom evaluation function, format: 'language:keyName=funcName'
export_checkpoints_dir
  Automatically export generated models to this directory.
check_constant_response
  Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.
verbose
  Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

Value

Creates a H2OModel object of the right type.

See Also

predict.H2OModel for prediction

---

h2o.range

Returns a vector containing the minimum and maximum of all the given arguments.

Description

Returns a vector containing the minimum and maximum of all the given arguments.

Usage

h2o.range(x, na.rm = FALSE, finite = FALSE)

Arguments

x
  An H2OFrame object.
na.rm
  logical. indicating whether missing values should be removed.
finite
  logical. indicating if all non-finite elements should be omitted.

See Also

range for the base R implementation.
h2o.rank_within_group_by

This function will add a new column rank where the ranking is produced as follows: 1. sorts the H2OFrame by columns sorted in by columns specified in group_by_cols and sort_cols in the directions specified by the ascending for the sort_cols. The sort directions for the group_by_cols are ascending only. 2. A new rank column is added to the frame which will contain a rank assignment performed next. The user can choose to assign a name to this new column. The default name is New_Rank_column. 3. For each groupby groups, a rank is assigned to the row starting from 1, 2, ... to the end of that group. 4. If sort_cols_sorted is TRUE, a final sort on the frame will be performed frame according to the sort_cols and the sort directions in ascending. If sort_cols_sorted is FALSE (by default), the frame from step 3 will be returned as is with no extra sort. This may provide a small speedup if desired.

Description

This function will add a new column rank where the ranking is produced as follows: 1. sorts the H2OFrame by columns sorted in by columns specified in group_by_cols and sort_cols in the directions specified by the ascending for the sort_cols. The sort directions for the group_by_cols are ascending only. 2. A new rank column is added to the frame which will contain a rank assignment performed next. The user can choose to assign a name to this new column. The default name is New_Rank_column. 3. For each groupby groups, a rank is assigned to the row starting from 1, 2, ... to the end of that group. 4. If sort_cols_sorted is TRUE, a final sort on the frame will be performed frame according to the sort_cols and the sort directions in ascending. If sort_cols_sorted is FALSE (by default), the frame from step 3 will be returned as is with no extra sort. This may provide a small speedup if desired.

Usage

h2o.rank_within_group_by(x, group_by_cols, sort_cols, ascending = NULL, new_col_name = "New_Rank_column", sort_cols_sorted = FALSE)

Arguments

x
The H2OFrame input to be sorted.
group_by_cols
a list of column names or indices to form the groupby groups
sort_cols
a list of column names or indices for sorting
ascending
a list of Boolean to determine if ascending sort (set to TRUE) is needed for each column in sort_cols (optional). Default is ascending sort for all. To perform descending sort, set value to FALSE
new_col_name
new column name for the newly added rank column if specified (optional). Default name is New_Rank_column.
sort_cols_sorted
Boolean to determine if the final returned frame is to be sorted according to the sort_cols and sort directions in ascending. Default is FALSE.

The following example is generated by Nidhi Mehta.
If the input frame is train:

```
ID Group_by_column num data Column_to_arrange_by num_1 fdata 12 1 2941.552
13 -3177.9077 1 12 1 2941.552 1 5 -13311.8247 1 12 2 -22722.174 1 3 -3177.9077 1 12 2 -22722.174 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171
0 13 3 -12776.884 1 4 28080.1607 0 13 1 -6049.830 1 5 -18421.6171 0 13 1 -6049.830 1 4 28080.1607 0 15 3 -16995.346 1 11 -9781.6373 0 16 1 -10003.593
0 3 -61284.6900 0 16 3 26052.495 1 3 -61284.6900 0 16 3 -22905.288 0 3 -61284.6900 0 17 2 -13465.496 1 2 12094.4851 1 17 2 -13465.496 1 3 -11772.1338
1 17 2 -13465.496 1 3 -415.1114 0 17 2 -3329.619 1 2 12094.4851 1 17 2 -3329.619 1 3 -415.1114
```

If the following commands are issued:

```r
rankedF1 <- h2o.rank_within_group_by(train, c("Group_by_column"), c("Column_to_arrange_by"), c(TRUE))
```

The returned frame rankedF1 will look like this:

```
ID Group_by_column num data Column_to_arrange_by num_1 fdata Column_to_arrange_by num_1 fdata
12 1 2941.552 1 3 -3177.9077 1 16 1 -10003.593 0 3 -61284.6900 0 2 13 1 -6049.830 0 4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171
```

If the following commands are issued:

```r
c(f("Group_by_column"), c("Column_to_arrange_by"), c(TRUE))
h2o.summary(rankedF1)
```

The returned frame rankedF1 will look like this:

```
ID Group_by_column num data Column_to_arrange_by num_1 fdata Column_to_arrange_by num_1 fdata
12 1 2941.552 1 3 -3177.9077 1 16 1 -10003.593 0 3 -61284.6900 0 2 13 1 -6049.830 0 4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171
```

If the following commands are issued:

```r
c(f("Group_by_column"), c("Column_to_arrange_by"), c(TRUE), sort_cols_sorted=TRUE)
h2o.summary(rankedF1)
```

The returned frame will be sorted according to sortCols and hence look like this instead:

```
ID Group_by_column num data Column_to_arrange_by num_1 fdata Column_to_arrange_by num_1 fdata
12 1 2941.552 1 3 -3177.9077 1 16 1 -10003.593 0 3 -61284.6900 0 2 13 1 -6049.830 0 4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171
```

---

`h2o.rbind`  
*Combine H2O Datasets by Rows*

**Description**

Takes a sequence of H2O data sets and combines them by rows

**Usage**

```
h2o.rbind(...)  
```
Arguments

A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number and types of columns.

Value

An H2OFrame object containing the combined arguments row-wise.

See Also

rbind for the base R method.

Examples

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_rbind <- h2o.rbind(prostate, prostate)
head(prostate_rbind)
dim(prostate)
dim(prostate_rbind)
## End(Not run)
```
See Also

h2o.glrm for making an H2ODimReductionModel.

Examples

## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_glrm <- h2o.glrm(training_frame = iris_hf, k = 4, transform = "STANDARDIZE",
loss = "Quadratic", multi_loss = "Categorical", max_iterations = 1000)
iris_rec <- h2o.reconstruct(iris_glrm, iris_hf, reverse_transform = TRUE)
head(iris_rec)

## End(Not run)

h2o.relevel

Reorders levels of an H2O factor, similarly to standard R's relevel.

Description

The levels of a factor are reordered so that the reference level is at level 0, remaining levels are
moved down as needed.

Usage

h2o.relevel(x, y)

Arguments

x factor column in h2o frame
y reference level (string)

Value

new reordered factor column

Examples

## Not run:
library(h2o)
h2o.init()

# Convert iris dataset to an H2OFrame
iris_hf <- as.h2o(iris)
# Look at current ordering of the Species column levels
h2o.levels(iris_hf["Species"])
# "setosa"  "versicolor"  "virginica"
# Change the reference level to "virginica"
iris_hf["Species"] <- h2o.relevel(x = iris_hf["Species"], y = "virginica")
# Observe new ordering
h2o.levels(iris_hf["Species"])
# "virginica"  "setosa"  "versicolor"
h2o.removeAll

Remove All Objects on the H2O Cluster

Description

Removes the data from the h2o cluster, but does not remove the local references. Retains frames and vectors specified in retained_elements argument. Retained keys must be keys of models and frames only. For models retained, training and validation frames are retained as well. Cross validation models of a retained model are NOT retained automatically, those must be specified explicitly.

Usage

h2o.removeAll(timeout_secs = 0, retained_elements = c())

Arguments

timeout_secs       Timeout in seconds. Default is no timeout.
retained_elements  Frames and vectors to be retained. Other keys provided are ignored.

See Also

h2o.rm

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()
h2o.removeAll()
h2o.ls()

## End(Not run)

h2o.removeVecs

Delete Columns from an H2OFrame

Description

Delete the specified columns from the H2OFrame. Returns an H2OFrame without the specified columns.

Usage

h2o.removeVecs(data, cols)
**h2o.rep_len**

**Replicate Elements of Vectors or Lists into H2O**

**Arguments**
- **data** The H2OFrame.
- **cols** The columns to remove.

**Description**

`h2o.rep_len` performs just as `rep` does. It replicates the values in `x` in the H2O backend.

**Usage**

```r
h2o.rep_len(x, length.out)
```

**Arguments**
- **x** an H2O frame
- **length.out** non negative integer. The desired length of the output vector.

**Value**

Creates an H2OFrame of the same type as `x`

---

**h2o.residual_deviance**

**Retrieve the residual deviance**

**Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual deviance value is returned. If more than one parameter is set to TRUE, then a named vector of residual deviances are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**
- **object** An H2OModel or H2OModelMetrics
- **train** Retrieve the training residual deviance
- **valid** Retrieve the validation residual deviance
- **xval** Retrieve the cross-validation residual deviance
**h2o.residual_dof**

*Retrieve the residual degrees of freedom*

**Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of residual degrees of freedom are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.residual_dof(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- `object`: An H2OModel or H2OModelMetrics
- `train`: Retrieve the training residual degrees of freedom
- `valid`: Retrieve the validation residual degrees of freedom
- `xval`: Retrieve the cross-validation residual degrees of freedom

---

**h2o.rm**

*Delete Objects In H2O*

**Description**

Remove the h2o Big Data object(s) having the key name(s) from ids.

**Usage**

```r
h2o.rm(ids, cascade = TRUE)
```

**Arguments**

- `ids`: The object or hex key associated with the object to be removed or a vector/list of those things.
- `cascade`: Boolean, if set to TRUE (default), the object dependencies (e.g. submodels) are also removed.

**See Also**

- `h2o.assign`, `h2o.ls`
**h2o.rmse**

*Retrieves Root Mean Squared Error Value*

**Description**

Retrieves the root mean squared error value from an H2OModelMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training RMSE value is returned. If more than one parameter is set to TRUE, then a named vector of RMSEs are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.rmse(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**: An H2OModelMetrics object of the correct type.
- **train**: Retrieve the training RMSE
- **valid**: Retrieve the validation RMSE
- **xval**: Retrieve the cross-validation RMSE

**Details**

This function only supports H2OBinomialMetrics, H2OMultinomialMetrics, and H2ORegressionMetrics objects.

**See Also**

- `h2o.auc` for AUC, `h2o.mse` for RMSE, and `h2o.metric` for the various threshold metrics. See `h2o.performance` for creating H2OModelMetrics objects.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.rmse(perf)

## End(Not run)
```
h2o.rmsle returns the Root Mean Squared Log Error

**Description**

Retrieves the root mean squared log error (RMSLE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training rmsle value is returned. If more than one parameter is set to TRUE, then a named vector of rmsles are returned, where the names are "train", "valid" or "xval".

**Usage**

h2o.rmsle(object, train = FALSE, valid = FALSE, xval = FALSE)

**Arguments**

- object: An H2OModel object.
- train: Retrieve the training rmsle
- valid: Retrieve the validation set rmsle if a validation set was passed in during model build time.
- xval: Retrieve the cross-validation rmsle

**Examples**

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)

h2o.rmsle(m)
## End(Not run)
```

h2o.round rounds doubles/floats to the given number of decimal places.

**Description**

Round doubles/floats to the given number of decimal places.

**Usage**

h2o.round(x, digits = 0)

round(x, digits = 0)
**h2o.rstrip**

### Arguments

- **x**: An H2OFrame object.
- **digits**: Number of decimal places to round doubles/floats. Rounding to a negative number of decimal places is

### See Also

- **round** for the base R implementation.

---

**h2o.runif**

### Produce a Vector of Random Uniform Numbers

### Description

Creates a vector of random uniform numbers equal in length to the length of the specified H2O dataset.

### Usage

```
h2o.runif(x, seed = -1)
```
Arguments

x  An H2OFrame object.
seed  A random seed used to generate draws from the uniform distribution.

Value

A vector of random, uniformly distributed numbers. The elements are between 0 and 1.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
s <- h2o.runif(prostate)
summary(s)
prostate_train <- prostate[s <= 0.8,]
prostate_test <- prostate[s > 0.8,]
nrow(prostate_train) + nrow(prostate_test)
## End(Not run)

h2o.saveModel  Save an H2O Model Object to Disk

Description

Save an H2OModel to disk. (Note that ensemble binary models can be saved.)

Usage

h2o.saveModel(object, path = ",", force = FALSE)

Arguments

object  an H2OModel object.
path  string indicating the directory the model will be written to.
force  logical, indicates how to deal with files that already exist.

Details

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

See Also

h2o.loadModel for loading a model to H2O from disk
h2o.saveModelDetails

Examples

```r
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.importFile(path = paste("https://raw.githubusercontent.com",
#     "h2oai/h2o-3.11-2-master/smalldata/logreg/prostate.csv", sep = "/"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
#     training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModel(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)

## End(Not run)
```

h2o.saveModelDetails  
Save an H2O Model Details

Description

Save Model Details of an H2O Model in JSON Format

Usage

```r
h2o.saveModelDetails(object, path = "", force = FALSE)
```

Arguments

- `object`: an H2OModel object.
- `path`: string indicating the directory the model details will be written to.
- `force`: logical, indicates how to deal with files that already exist.

Details

Model Details will download as a JSON file. In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

Examples

```r
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package = "h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
#     training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModelDetails(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)

## End(Not run)
```
198

h2o.scale

h2o.saveMojo

Save an H2O Model Object as Mojo to Disk

Description
Save an MOJO (Model Object, Optimized) to disk.
Usage
h2o.saveMojo(object, path = "", force = FALSE)
Arguments
object

an H2OModel object.

path

string indicating the directory the model will be written to.

force

logical, indicates how to deal with files that already exist.

Details
MOJO will download as a zip file. In the case of existing files force = TRUE will overwrite the
file. Otherwise, the operation will fail.
See Also
h2o.saveModel for saving a model to disk as a binary object.
Examples
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package="h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE","RACE","PSA","DCAPS"),
#
training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveMojo(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)

h2o.scale

Scaling and Centering of an H2OFrame

Description
Centers and/or scales the columns of an H2O dataset.
Usage
h2o.scale(x, center = TRUE, scale = TRUE, inplace = FALSE)


Arguments

x  An H2OFrame object.
center  either a logical value or numeric vector of length equal to the number of columns of x.
scale  either a logical value or numeric vector of length equal to the number of columns of x.
inplace  a logical values indicating whether directly overwrite original data (disabled by default). Exposed for backwards compatibility (prior versions of this functions were always doing an inplace update).

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- h2o.scale(iris_hf[, 1:4])
```

h2o.scoreHistory  Retrieve Model Score History

Description

Retrieve Model Score History

Usage

h2o.scoreHistory(object)

Arguments

object  An H2OModel object.

h2o.sd  Standard Deviation of a column of data.

Description

Obtain the standard deviation of a column of data.

Usage

h2o.sd(x, na.rm = FALSE)

sd(x, na.rm = FALSE)
Arguments

\( x \)  
An H2OFrame object.

\( \text{na.rm} \)  
logical. Should missing values be removed?

See Also

\( \text{h2o.var} \) for variance, and \( \text{sd} \) for the base R implementation.

Examples

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
sd(prostate$AGE)

## End(Not run)
```

---

**h2o.sdev**  
Retrieve the standard deviations of principal components

Description

Retrieve the standard deviations of principal components

Usage

\( \text{h2o.sdev(object)} \)

Arguments

\( \text{object} \)  
An \text{H2ODimReductionModel} object.

---

**h2o.setLevels**  
Set Levels of H2O Factor Column

Description

Works on a single categorical vector. New domains must be aligned with the old domains. This call has \text{SIDE EFFECTS} and mutates the column in place (change of the levels will also affect all the frames that are referencing this column). If you want to make a copy of the column instead, use parameter \text{in.place = FALSE}.

Usage

\( \text{h2o.setLevels(x, levels, in.place = TRUE)} \)
h2o.setTimezone

Set the Time Zone on the H2O cluster

Description
Set the Time Zone on the H2O cluster

Usage
h2o.setTimezone(tz)

Arguments
tz The desired timezone.

h2o.set_s3_credentials

Creates a new Amazon S3 client internally with specified credentials.

Description
There are no validations done to the credentials. Incorrect credentials are thus revealed with first S3 import call.

Usage
h2o.set_s3_credentials(secretKeyId, secretAccessKey)

Arguments
secretKeyId Amazon S3 Secret Key ID (provided by Amazon)
secretAccessKey Amazon S3 Secret Access Key (provided by Amazon)

Arguments

x A single categorical column.
levels A character vector specifying the new levels. The number of new levels must match the number of old levels.
in.place Indicates whether new domain will be directly applied to the column (in place change) or if a copy of the column will be created with the given domain levels.

Examples
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
new.levels <- c("setosa", "versicolor", "caroliniana")
iris_hf$Species <- h2o.setLevels(iris_hf$Species, new.levels, in.place = FALSE)
h2o.levels(iris_hf$Species)
## End(Not run)
h2o.shutdown

Description
Enable Progress Bar

Usage
h2o.show_progress()

h2o.shutdown
Shut Down H2O Instance

Description
Shut down the specified instance. All data will be lost.

Usage
h2o.shutdown(prompt = TRUE)

Arguments
prompt A logical value indicating whether to prompt the user before shutting down the H2O server.

Details
This method checks if H2O is running at the specified IP address and port, and if it is, shuts down that H2O instance.

WARNING
All data, models, and other values stored on the server will be lost! Only call this function if you and all other clients connected to the H2O server are finished and have saved your work.

Note
Users must call h2o.shutdown explicitly in order to shut down the local H2O instance started by R. If R is closed before H2O, then an attempt will be made to automatically shut down H2O. This only applies to local instances started with h2o.init, not remote H2O servers.

See Also
h2o.init
Examples

# Don't run automatically to prevent accidentally shutting down a cluster
## Not run:
library(h2o)
h2o.init()
h2o.shutdown()

## End(Not run)

---

**h2o.signif**  
_Round doubles/floats to the given number of significant digits._

**Description**
Round doubles/floats to the given number of significant digits.

**Usage**

```
h2o.signif(x, digits = 6)
```

**Arguments**

- **x**: An H2OFrame object.
- **digits**: Number of significant digits to round doubles/floats.

**See Also**

signif for the base R implementation.

---

**h2o.sin**  
_Compute the sine of x_

**Description**
Compute the sine of x

**Usage**

```
h2o.sin(x)
```

**Arguments**

- **x**: An H2OFrame object.

**See Also**

sin for the base R implementation.
h2o.skewness  

**Description**

Obtain the skewness of a column of a parsed H2O data object.

**Usage**

```r
h2o.skewness(x, ..., na.rm = TRUE)
skewness.H2OFrame(x, ..., na.rm = TRUE)
```

**Arguments**

- `x`: An H2OFrame object.
- `...`: Further arguments to be passed from or to other methods.
- `na.rm`: A logical value indicating whether NA or missing values should be stripped before the computation.

**Value**

Returns a list containing the skewness for each column (NaN for non-numeric columns).

**Examples**

```r
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.skewness(prostate$AGE)
## End(Not run)
```

h2o.splitFrame  

**Description**

Split an existing H2O data set according to user-specified ratios. The number of subsets is always 1 more than the number of given ratios. Note that this does not give an exact split. H2O is designed to be efficient on big data using a probabilistic splitting method rather than an exact split. For example, when specifying a split of 0.75/0.25, H2O will produce a test/train split with an expected value of 0.75/0.25 rather than exactly 0.75/0.25. On small datasets, the sizes of the resulting splits will deviate from the expected value more than on big data, where they will be very close to exact.

**Usage**

```r
h2o.splitFrame(data, ratios = 0.75, destination_frames, seed = -1)
```
**Arguments**

- **data**: An H2OFrame object representing the data to split.
- **ratios**: A numeric value or array indicating the ratio of total rows contained in each split. Must total up to less than 1.
- **destination_frames**: An array of frame IDs equal to the number of ratios specified plus one.
- **seed**: Random seed.

**Value**

Returns a list of split H2OFrame’s

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_split <- h2o.splitFrame(iris_hf, ratios = c(0.2, 0.5))
head(iris_split[[1]])
summary(iris_split[[1]])
```

---

**h2o.sqrt**

*Compute the square root of x*

**Description**

Compute the square root of x

**Usage**

```r
h2o.sqrt(x)
```

**Arguments**

- **x**: An H2OFrame object.

**See Also**

- `sqrt` for the base R implementation.
**h2o.stackedEnsemble**  
*Builds a Stacked Ensemble*

**Description**
Build a stacked ensemble (aka. Super Learner) using the H2O base learning algorithms specified by the user.

**Usage**
```r
h2o.stackedEnsemble(x, y, training_frame, model_id = NULL, 
validation_frame = NULL, blending_frame = NULL, 
base_models = list(), metalearnern_algorithm = c("AUTO", "glm", "gbm", 
"drf", "deeplearning"), metalearnern_nfolds = 0, 
metalearnern_fold_assignment = c("AUTO", "Random", "Modulo", 
"Stratified"), metalearnern_fold_column = NULL, 
metalearnern_params = NULL, seed = -1, keep_levelone_frame = FALSE, 
export_checkpoints_dir = NULL)
```

**Arguments**
- **x** (Optional). A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used. Training frame is used only to compute ensemble training metrics.
- **y** The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.
- **training_frame** Id of the training data frame.
- **model_id** Destination id for this model; auto-generated if not specified.
- **validation_frame** Id of the validation data frame.
- **blending_frame** Frame used to compute the predictions that serve as the training frame for the metalearnern (triggers blending mode if provided)
- **base_models** List of models (or model ids) to ensemble/stack together. If not using blending frame, then models must have been cross-validated using nfolds > 1, and folds must be identical across models.
- **metalearnern_algorithm** Type of algorithm to use as the metalearnern. Options include 'AUTO' (GLM with non negative weights; if validation_frame is present, a lambda search is performed), 'glm' (GLM with default parameters), 'gbm' (GBM with default parameters), 'drf' (Random Forest with default parameters), or 'deeplearning' (Deep Learning with default parameters). Must be one of: "AUTO", "glm", "gbm", "drf", "deeplearning". Defaults to AUTO.
- **metalearnern_nfolds** Number of folds for K-fold cross-validation of the metalearnern algorithm (0 to disable or >= 2). Defaults to 0.
h2o.startLogging

**Start Writing H2O R Logs**

Description

Begin logging H2o R POST commands and error responses to local disk. Used primarily for debugging purposes.

Usage

```
> h2o.startLogging(file)
```

Arguments

- `file` : a character string name for the file, automatically generated

See Also

```
h2o.stopLogging, h2o.clearLog, h2o.openLog
```
Examples

```r
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
## End(Not run)
```

h2o.std_coef_plot

Plot Standardized Coefficient Magnitudes

Description

Plot a GLM model’s standardized coefficient magnitudes.

Usage

```r
h2o.std_coef_plot(model, num_of_features = NULL)
```

Arguments

- `model`: A trained generalized linear model
- `num_of_features`: The number of features to be shown in the plot

See Also

- `h2o.varimp_plot` for variable importances plot of random forest, GBM, deep learning.

Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
prostate_glm <- h2o glm(y = "CAPSULE", x = c("AGE","RACE","PSA","DCAPS"),
training_frame = prostate, family = "binomial",
nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.std_coef_plot(prostate_glm)
## End(Not run)
```
**h2o.stopLogging**

**Stop Writing H2O R Logs**

**Description**

Halt logging of H2O R POST commands and error responses to local disk. Used primarily for debugging purposes.

**Usage**

```r
h2o.stopLogging()
```

**See Also**

`h2o.startLogging`, `h2o.clearLog`, `h2o.openLog`

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
## End(Not run)
```

---

**h2o.str**

**Display the structure of an H2OFrame object**

**Description**

Display the structure of an H2OFrame object

**Usage**

```r
h2o.str(object, ..., cols = FALSE)
```

**Arguments**

- **object**: An H2OFrame.
- **...**: Further arguments to be passed from or to other methods.
- **cols**: Print the per-column str for the H2OFrame.
**h2o.stringdist**

*Compute element-wise string distances between two H2OFrames*

**Description**

Compute element-wise string distances between two H2OFrames. Both frames need to have the same shape (N x M) and only contain string/factor columns. Return a matrix (H2OFrame) of shape N x M.

**Usage**

```r
h2o.stringdist(x, y, method = c("lv", "lcs", "qgram", "jaccard", "jw", "soundex"), compare_empty = TRUE)
```

**Arguments**

- **x**: An H2OFrame
- **y**: A comparison H2OFrame
- **method**: A string identifier indicating what string distance measure to use. Must be one of: "lv" - Levenshtein distance "lcs" - Longest common substring distance "qgram" - q-gram distance "jaccard" - Jaccard distance between q-gram profiles "jw" - Jaro, or Jaro-Winker distance "soundex" - Distance based on soundex encoding
- **compare_empty**: if set to FALSE, empty strings will be handled as NaNs

**Examples**

```r
## Not run:
h2o.init()
x <- as.h2o(c("Martha", "Dwayne", "Dixon"))
y <- as.character(as.h2o(c("Marhta", "Duane", "Dicksonx")))
h2o.stringdist(x, y, method = "jw")
## End(Not run)
```

**h2o.strsplit**

*String Split*

**Description**

String Split

**Usage**

```r
h2o.strsplit(x, split)
```

**Arguments**

- **x**: The column whose strings must be split.
- **split**: The pattern to split on.
Value

An H2OFrame where each column is the outcome of the string split.

Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_split <- as.h2o("Split at every character.")
split_string <- h2o.strsplit(string_to_split,"")

## End(Not run)
```

### h2o.sub

String Substitute

Description

Creates a copy of the target column in which each string has the first occurrence of the regex pattern replaced with the replacement substring.

Usage

```r
h2o.sub(pattern, replacement, x, ignore.case = FALSE)
```

Arguments

- `pattern`: The pattern to replace.
- `replacement`: The replacement pattern.
- `x`: The column on which to operate.
- `ignore.case`: Case sensitive or not

Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_sub <- as.h2o("r tutorial")
sub_string <- h2o.sub("r ", "H2O ", string_to_sub)

## End(Not run)
```
**h2o.substring**

**Substring**

**Description**

Returns a copy of the target column that is a substring at the specified start and stop indices, inclusive. If the stop index is not specified, then the substring extends to the end of the original string. If start is longer than the number of characters in the original string, or is greater than stop, an empty string is returned. Negative start is coerced to 0.

**Usage**

```r
h2o.substring(x, start, stop = "[]")
```

```r
h2o.substr(x, start, stop = "[]")
```

**Arguments**

- `x`: The column on which to operate.
- `start`: The index of the first element to be included in the substring.
- `stop`: Optional, The index of the last element to be included in the substring.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_substring <- as.h2o("1234567890")
substr <- h2o.substring(string_to_substring, 2) #Get substring from second index onwards
## End(Not run)
```

---

**h2o.sum**

**Compute the frame's sum by-column (or by-row).**

**Description**

Compute the frame’s sum by-column (or by-row).

**Usage**

```r
h2o.sum(x, na.rm = FALSE, axis = 0, return_frame = FALSE)
```

**Arguments**

- `x`: An H2OFrame object.
- `na.rm`: logical, indicating whether missing values should be removed.
- `axis`: An int that indicates whether to do down a column (0) or across a row (1). For row or column sums, the return_frame parameter must be TRUE.
- `return_frame`: A boolean that indicates whether to return an H2O frame or one single aggregated value. Default is FALSE.
See Also

sum for the base R implementation.

h2o.summary

Summarizes the columns of an H2OFrame.

Description

A method for the summary generic. Summarizes the columns of an H2O data frame or subset of columns and rows using vector notation (e.g. dataset[row, col]).

Usage

h2o.summary(object, factors = 6L, exact_quantiles = FALSE, ...)

## S3 method for class 'H2OFrame'
summary(object, factors, exact_quantiles, ...)

Arguments

object An H2OFrame object.
factors The number of factors to return in the summary. Default is the top 6.
exact_quantiles Compute exact quantiles or use approximation. Default is to use approximation.
... Further arguments passed to or from other methods.

Details

By default it uses approximated version of quantiles computation, however, user can modify this behavior by setting up exact_quantiles argument to true.

Value

A table displaying the minimum, 1st quartile, median, mean, 3rd quartile and maximum for each numeric column, and the levels and category counts of the levels in each categorical column.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
summary(prostate)
summary(prostate$GLEASON)
summary(prostate[,4:6])
summary(prostate, exact_quantiles=TRUE)

## End(Not run)
**h2o.svd**

*Singular value decomposition of an H2O data frame using the power method*

**Description**

Singular value decomposition of an H2O data frame using the power method

**Usage**

```r
h2o.svd(training_frame, x, destination_key, model_id = NULL, validation_frame = NULL, ignore_const_cols = TRUE, score_each_iteration = FALSE, transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"), svd_method = c("GramSVD", "Power", "Randomized"), nv = 1, max_iterations = 1000, seed = -1, keep_u = TRUE, u_name = NULL, use_all_factor_levels = TRUE, max_runtime_secs = 0, export_checkpoints_dir = NULL)
```

**Arguments**

- **training_frame**  
  Id of the training data frame.
- **x**  
  A vector containing the character names of the predictors in the model.
- **destination_key**  
  (Optional) The unique key assigned to the resulting model. Automatically generated if none is provided.
- **model_id**  
  Destination id for this model; auto-generated if not specified.
- **validation_frame**  
  Id of the validation data frame.
- **ignore_const_cols**  
  Logical. Ignore constant columns. Defaults to TRUE.
- **score_each_iteration**  
  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
- **transform**  
  Transformation of training data. Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.
- **svd_method**  
  Method for computing SVD. (Caution: Randomized is currently experimental and unstable) Must be one of: "GramSVD", "Power", "Randomized". Defaults to GramSVD.
- **nv**  
  Number of right singular vectors. Defaults to 1.
- **max_iterations**  
  Maximum iterations. Defaults to 1000.
- **seed**  
  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
- **keep_u**  
  Logical. Save left singular vectors? Defaults to TRUE.
- **u_name**  
  Frame key to save left singular vectors
- **use_all_factor_levels**  
  Logical. Whether first factor level is included in each categorical expansion. Defaults to TRUE.
max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable.
Defaults to 0.
export_checkpoints_dir
Automatically export generated models to this directory.

Value
an object of class H2ODimReductionModel.

References
N. Halko, P.G. Martinsson, J.A. Tropp. Finding structure with randomness: Probabilistic algorithms

Examples
```r
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.svd(training_frame = australia, nv = 8)
## End(Not run)
```

---

h2o.table

Cross Tabulation and Table Creation in H2O

Description

Uses the cross-classifying factors to build a table of counts at each combination of factor levels.

Usage

`h2o.table(x, y = NULL, dense = TRUE)`

`table.H2OFrame(x, y = NULL, dense = TRUE)`

Arguments

- **x** An H2OFrame object with at most two columns.
- **y** An H2OFrame similar to x, or `NULL`.
- **dense** A logical for dense representation, which lists only non-zero counts, 1 combi-
  nation per row. Set to `FALSE` to expand counts across all combinations.

Value

Returns a tabulated H2OFrame object.
Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
summary(prostate)

# Counts of the ages of all patients
head(h2o.table(prostate[, 3]))
h2o.table(prostate[, 3])

# Two-way table of ages (rows) and race (cols) of all patients
head(h2o.table(prostate[, c(3, 4)]))
h2o.table(prostate[, c(3, 4)])

## End(Not run)
```

h2o.tabulate

Tabulation between Two Columns of an H2OFrame

Description

Simple Co-Occurrence based tabulation of \(X\) vs \(Y\), where \(X\) and \(Y\) are two Vecs in a given dataset. Uses histogram of given resolution in \(X\) and \(Y\). Handles numerical/categorical data and missing values. Supports observation weights.

Usage

```r
h2o.tabulate(data, x, y, weights_column = NULL, nbins_x = 50,
             nbins_y = 50)
```

Arguments

- `data` : An H2OFrame object.
- `x` : predictor column
- `y` : response column
- `weights_column` : (optional) observation weights column
- `nbins_x` : number of bins for predictor column
- `nbins_y` : number of bins for response column

Value

Returns two TwoDimTables of 3 columns each: count_table: \(X\) counts \(Y\) counts
response_table: \(X\) \(\text{mean}Y\) counts
Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- as.h2o(iris)
tab <- h2o.tabulate(data = df, x = "Sepal.Length", y = "Petal.Width",
                   weights_column = NULL, nbins_x = 10, nbins_y = 10)
plot(tab)
## End(Not run)
```

---

**h2o.tan**

*Compute the tangent of x*

**Description**

Compute the tangent of x

**Usage**

```r
h2o.tan(x)
```

**Arguments**

- `x` - An H2OFrame object.

**See Also**

- `tan` for the base R implementation.

---

**h2o.tanh**

*Compute the hyperbolic tangent of x*

**Description**

Compute the hyperbolic tangent of x

**Usage**

```r
h2o.tanh(x)
```

**Arguments**

- `x` - An H2OFrame object.

**See Also**

- `tanh` for the base R implementation.
h2o.targetencoder

Transformation of a categorical variable with a mean value of the target variable

Description

Transformation of a categorical variable with a mean value of the target variable

Usage

h2o.targetencoder(x, y, training_frame, blending = FALSE, k = 10,
        f = 20, data_leakage_handling = c("None", "KFold", "LeaveOneOut"),
        model_id = NULL, fold_column = NULL)

Arguments

x
(Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y
The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame
Id of the training data frame.

blending
Logical. Blending enabled/disabled. Defaults to FALSE.

k
Inflection point. Used for blending (if enabled). Blending is to be enabled separately using the 'blending' parameter. Defaults to 10.

f
Smoothing. Used for blending (if enabled). Blending is to be enabled separately using the 'blending' parameter. Defaults to 20.

data_leakage_handling
Data leakage handling strategy. Must be one of: "None", "KFold", "LeaveOneOut". Defaults to None.

model_id
Destination id for this model; auto-generated if not specified.

fold_column
Column with cross-validation fold index assignment per observation.

Examples

## Not run:
# library(h2o)
# h2o.init()
#
# Create a target encoder
# target_encoder <- h2o.targetencoder(training_frame = data, encoded_columns= encoded_columns,
# target_column = "survived", fold_column = "pclass", data_leakage_handling = "KFold")
#
# Apply the Target Encoder transformation
# encoded_data <- h2o.transform(target_encoder, data)

## End(Not run)
Apply Target Encoding Map to Frame

Description

Usage

```r
h2o.target_encode_apply(data, x, y, target_encode_map, holdout_type, fold_column = NULL, blended_avg = TRUE, noise_level = NULL, seed = -1)
```

Arguments

- `data`: An H2OFrame object with which to apply the target encoding map.
- `x`: A list containing the names or indices of the variables to encode. A target encoding column will be created for each element in the list. Items in the list can be multiple columns. For example, if `x = list(c("A"), c("B", "C"))`, then the resulting frame will have a target encoding column for A and a target encoding column for B & C (in this case, we group by two columns).
- `y`: The name or column index of the response variable in the data. The response variable can be either numeric or binary.
- `target_encode_map`: A list of H2OFrame objects that is the results of the `h2o.target_encode_create` function.
- `holdout_type`: The holdout type used. Must be one of: "LeaveOneOut", "KFold", "None".
- `fold_column`: (Optional) The name or column index of the fold column in the data. Defaults to NULL (no 'fold_column'). Only required if 'holdout_type' = "KFold".
- `blended_avg`: Logical. (Optional) Whether to perform blended average.
- `noise_level`: (Optional) The amount of random noise added to the target encoding. This helps prevent overfitting. Defaults to 0.01 * range of y.
- `seed`: (Optional) A random seed used to generate draws from the uniform distribution for random noise. Defaults to -1.

Value

Returns an H2OFrame object containing the target encoding per record.

See Also

- `h2o.target_encode_create` for creating the target encoding map
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Get Target Encoding Frame on bank-additional-full data with numeric 'y'
data <- h2o.importFile(  
  path = "https://s3.amazonaws.com/h2o-public-test-data/smalldata/demos/bank-additional-full.csv")
splits <- h2o.splitFrame(data, seed = 1234)
train <- splits[[1]]
test <- splits[[2]]
mapping <- h2o.target_encode_create(data = train, x = list(c("job"), c("job", "marital")),
  y = "age")

# Apply mapping to the training dataset
train_encode <- h2o.target_encode_apply(data = train, x = list(c("job"), c("job", "marital")),
  y = "age", mapping, holdout_type = "LeaveOneOut")

# Apply mapping to a test dataset
test_encode <- h2o.target_encode_apply(data = test, x = list(c("job"), c("job", "marital")),
  y = "age", target_encode_map = mapping,
  holdout_type = "None")

## End(Not run)
```

---

**h2o.target_encode_create**

Create Target Encoding Map

Description

Creates a target encoding map based on group-by columns ('x') and a numeric or binary target column ('y'). Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models. A Target Encoding tutorial is available here: [https://github.com/h2oai/h2o-tutorials/blob/master/best-practices/categorical-predictors/target_encoding.md](https://github.com/h2oai/h2o-tutorials/blob/master/best-practices/categorical-predictors/target_encoding.md).

Usage

```
h2o.target_encode_create(data, x, y, fold_column = NULL)
```

Arguments

- **data**: An H2OFrame object with which to create the target encoding map.
- **x**: A list containing the names or indices of the variables to encode. A target encoding map will be created for each element in the list. Items in the list can be multiple columns. For example, if `x = list(c("A"), c("B", "C"))`, then there will be one mapping frame for A and one mapping frame for B & C (in this case, we group by two columns).
- **y**: The name or column index of the response variable in the data. The response variable can be either numeric or binary.
- **fold_column**: (Optional) The name or column index of the fold column in the data. Defaults to NULL (no 'fold_column').
Value

Returns a list of H2OFrame objects containing the target encoding mapping for each column in ‘x’.

See Also

- `h2o.target_encode_apply` for applying the target encoding mapping to a frame.

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Get Target Encoding Map on bank-additional-full data with numeric response
data <- h2o.importFile(
  path = "https://s3.amazonaws.com/h2o-public-test-data/smalldata/demos/bank-additional-full.csv")
mapping_age <- h2o.target_encoding_create(data = data, x = list(c("job"), c("job", "marital")),
                                              y = "age")
head(mapping_age)

# Get Target Encoding Map on bank-additional-full data with binary response
mapping_y <- h2o.target_encoding_create(data = data, x = list(c("job"), c("job", "marital")),
                                         y = "y")
head(mapping_y)

## End(Not run)
```

---

`h2o.target_encode_fit`  
*Deprecated API. Please use `h2o.targetencoder model instead.*

Description

Create Target Encoding Map

Usage

```r
h2o.target_encode_fit(frame, x, y, fold_column = NULL)
```

Arguments

- `frame`  
  An H2OFrame object with which to create the target encoding map.

- `x`  
  List of categorical column names or indices that we want apply target encoding to. Case when item in the list is a list of multiple columns itself is not supported for now.

- `y`  
  The name or column index of the response variable in the frame.

- `fold_column`  
  (Optional) The name or column index of the fold column in the frame.
Details

This is an API for a new target encoding implemented in JAVA. Creates a target encoding map based on group-by columns ('x') and binary target column ('y'). Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models.

Value

Returns an object containing the target encoding mapping for each column in 'x'.

See Also

h2o.target_encode_transform for applying the target encoding mapping to a frame.

**Description**

This is an API for a new target encoding implemented in JAVA. Applies a target encoding map to an H2OFrame object. Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models.

**Usage**

```r
h2o.target_encode_transform(frame, x, y, target_encode_map, holdout_type, fold_column = NULL, blended_avg = TRUE, inflection_point = 10, smoothing = 20, noise = -1, seed = -1)
```

**Arguments**

- **frame**: An H2OFrame object with which to apply the target encoding map.
- **x**: List of categorical column names or indices that we want to apply target encoding to. Case when item in the list is a list of multiple columns itself is not supported for now.
- **y**: The name or column index of the response variable in the frame.
- **target_encode_map**: An object that is a result of the calling `h2o.target_encode_fit` function.
- **holdout_type**: Supported options:
  1) "kfold" - encodings for a fold are generated based on out-of-fold data.
  2) "loo" - leave one out. Current row’s response value is subtracted from the pre-calculated per-level frequencies.
  3) "none" - we do not holdout anything. Using whole frame for training
- **fold_column**: (Optional) The name or column index of the fold column in the frame.
- **blended_avg**: Logical. (Optional) Whether to perform blended average. Defaults to TRUE
inflection_point
(Optional) Parameter for blending. Used to calculate ‘lambda’. Determines half of the minimal sample size for which we completely trust the estimate based on the sample in the particular level of categorical variable. Default value is 10.

smoothing
(Optional) Parameter for blending. Used to calculate ‘lambda’. Controls the rate of transition between the particular level’s posterior probability and the prior probability. For smoothing values approaching infinity it becomes a hard threshold between the posterior and the prior probability. Default value is 20.

noise
(Optional) The amount of random noise added to the target encoding. This helps prevent overfitting. Defaults to 0.01 * range of y.

seed
(Optional) A random seed used to generate draws from the uniform distribution for random noise. Defaults to -1.

Value
Returns an H2OFrame object containing the target encoding per record.

See Also
h2o.target_encode_fit for creating the target encoding map

---

h2o.toFrame

Convert a word2vec model into an H2OFrame

Description
Converts a given word2vec model into an H2OFrame. The frame represents learned word embeddings.

Usage
h2o.toFrame(word2vec)

Arguments

word2vec
A word2vec model.

Examples

```r
## Not run:
h2o.init()

# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors and return average vector for each sentence
h2o.toFrame(w2v_model) # -> Frame made of 2 rows and 2 columns

## End(Not run)
```
h2o.tokenize  

**Tokenize String**

**Description**

h2o.tokenize is similar to h2o.strsplit, the difference between them is that h2o.tokenize will store the tokenized text into a single column making it easier for additional processing (filtering stop words, word2vec algo, ...).

**Usage**

h2o.tokenize(x, split)

**Arguments**

- x: The column or columns whose strings to tokenize.
- split: The regular expression to split on.

**Value**

An H2OFrame with a single column representing the tokenized Strings. Original rows of the input DF are separated by NA.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_tokenize <- as.h2o("Split at every character and tokenize.")
tokenize_string <- h2o.tokenize(as.character(string_to_tokenize), ")
## End(Not run)
```

h2o.tolower  

**Convert strings to lowercase**

**Description**

Convert strings to lowercase

**Usage**

h2o.tolower(x)

**Arguments**

- x: An H2OFrame object whose strings should be lower cased

**Value**

An H2OFrame with all entries in lowercase format
Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_lower <- as.h2o("ABCDE")
lowered_string <- h2o.tolower(string_to_lower)

## End(Not run)
```

### Description

Extract the top N percent of values of a column and return it in a H2OFrame.

### Usage

```r
h2o.topN(x, column, nPercent)
```

#### Arguments

- **x**: an H2OFrame
- **column**: is a column name or column index to grab the top N percent value from
- **nPercent**: is a top percentage value to grab

#### Value

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the topN values

### Description

Get the total sum of squares.

### Usage

```r
h2o.totss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### Arguments

- **object**: An H2OClusteringModel object.
- **train**: Retrieve the training total sum of squares
- **valid**: Retrieve the validation total sum of squares
- **xval**: Retrieve the cross-validation total sum of squares
h2o.tot_withinss  
Get the total within cluster sum of squares.

Description
If "train", "valid", and "xval" parameters are FALSE (default), then the training tot_withinss value is returned. If more than one parameter is set to TRUE, then a named vector of tot_withinss' are returned, where the names are "train", "valid" or "xval".

Usage
h2o.tot_withinss(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments
- object  
  An H2OClusteringModel object.
- train  
  Retrieve the training total within cluster sum of squares
- valid  
  Retrieve the validation total within cluster sum of squares
- xval  
  Retrieve the cross-validation total within cluster sum of squares

h2o.toupper  
Convert strings to uppercase

Description
Convert strings to uppercase

Usage
h2o.toupper(x)

Arguments
- x  
  An H2OFrame object whose strings should be upper cased

Value
An H2OFrame with all entries in uppercase format

Examples
```r
## Not run:
library(h2o)
h2o.init()
string_to_upper <- as.h2o("abcde")
upper_string <- h2o.toupper(string_to_upper)
## End(Not run)
```
h2o.transform

Use H2O Transformation model and apply the underlying transformation

Description
Use H2O Transformation model and apply the underlying transformation

Usage
h2o.transform(model, ...)

Arguments
model A trained model representing the transformation strategy

... Transformation model-specific parameters

Value
Returns an H2OFrame object with data transformed.

h2o.transform,H2OTargetEncoderModel-method

Applies target encoding to a given dataset

Description
Applies target encoding to a given dataset

Usage
## S4 method for signature 'H2OTargetEncoderModel'

h2o.transform(model, data,
    data_leakage_handling = NULL, use_blending = NULL,
    inflection_point = -1, smoothing = -1, noise = -1, seed = -1)

Arguments
model A trained model representing the transformation strategy
data An H2OFrame with data to be transformed

data_leakage_handling Handling of data leakage. Available options are: ["None", "LeaveOneOut", "KFold"]. Defaults to "None".

use_blending Use blending during the transformation. Respects model settings when not set.

inflection_point Blending parameter. Only effective when blending is enabled. By default, model settings are respected, if not overridden by this setting.

smoothing Blending parameter. Only effective when blending is enabled. By default, model settings are respected, if not overridden by this setting.
noise
An amount of random noise added to the encoding. This helps prevent overfit-
ting. Defaults to 0.01 * range of response.

seed
A random seed used to generate draws from the uniform distribution for random
noise. Defaults to -1.

Value
Returns an H2OFrame object with data transformed.

---

### h2o.transform,H2OWordEmbeddingModel-method

*Transform words (or sequences of words) to vectors using a word2vec model.*

#### Description

Transform words (or sequences of words) to vectors using a word2vec model.

#### Usage

```r
## S4 method for signature 'H2OWordEmbeddingModel'
h2o.transform(model, words,
aggregate_method = c("NONE", "AVERAGE"))
```

#### Arguments

- **model**: A word2vec model.
- **words**: An H2OFrame made of a single column containing source words.
- **aggregate_method**: Specifies how to aggregate sequences of words. If method is 'NONE' then no aggregation is performed and each input word is mapped to a single word-vector. If method is 'AVERAGE' then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

#### Examples

```r
## Not run:
h2o.init()

# Build a simple word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)

# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

## End(Not run)
```
h2o.transform_word2vec

Transform words (or sequences of words) to vectors using a word2vec model.

Description

Transform words (or sequences of words) to vectors using a word2vec model.

Usage

h2o.transform_word2vec(word2vec, words, aggregate_method = c("NONE", "AVERAGE"))

Arguments

word2vec A word2vec model.
words An H2OFrame made of a single column containing source words.
aggregate_method Specifies how to aggregate sequences of words. If method is 'NONE' then no aggregation is performed and each input word is mapped to a single word-vector. If method is 'AVERAGE' then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

Examples

```r
## Not run:
h2o.init()
# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)
# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)
# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

## End(Not run)
```

h2o.trim

Trim Space

Description

Trim Space
Usage

h2o.trim(x)

Arguments

x  The column whose strings should be trimmed.

Examples

## Not run:
library(h2o)
h2o.init()
string_to_trim <- as.h2o("r tutorial")
trim_string <- h2o.trim(string_to_trim)
## End(Not run)

h2o.trunc  

**Truncate values in x toward 0**

Description

t trunc takes a single numeric argument x and returns a numeric vector containing the integers formed by truncating the values in x toward 0.

Usage

h2o.trunc(x)

Arguments

x  An H2OFrame object.

See Also

t trunc for the base R implementation.

h2o.unique  

**H2O Unique**

Description

Extract unique values in the column.

Usage

h2o.unique(x)

Arguments

x  An H2OFrame object.
Value

Returns an H2OFrame object.

Description

Usage example: `mojo_model <- h2o.upload_mojo(model_file_path = "/path/to/local/mojo.zip")
predictions <- h2o.predict(mojo_model, dataset)

Usage

h2o.upload_mojo(mojo_local_file_path)

Arguments

mojo_local_file_path

Filesystem path to the model imported

Value

Returns H2O Generic Model embedding given MOJO model

Examples

## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(), "/", mojo_original_name)

# Upload the MOJO from local filesystem and obtain a Generic model
mojo_model <- h2o.upload_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)
**h2o.var**

Variance of a column or covariance of columns.

**Description**

Compute the variance or covariance matrix of one or two H2OFrames.

**Usage**

```
h2o.var(x, y = NULL, na.rm = FALSE, use)
var(x, y = NULL, na.rm = FALSE, use)
```

**Arguments**

- `x` An H2OFrame object.
- `y` NULL (default) or an H2OFrame. The default is equivalent to `y = x`.
- `na.rm` logical. Should missing values be removed?
- `use` An optional character string indicating how to handle missing values. This must be one of the following: "everything" - outputs NaNs whenever one of its contributing observations is missing "all.obs" - presence of missing observations will throw an error "complete.obs" - discards missing values along with all observations in their rows so that only complete observations are used

**See Also**

`var` for the base R implementation. `h2o.sd` for standard deviation.

**Examples**

````
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
var(prostate$AGE)
## End(Not run)
```

---

**h2o.varimp**

Retrieve the variable importance.

**Description**

Retrieve the variable importance.

**Usage**

```
h2o.varimp(object)
```

**Arguments**

- `object` An H2OModel object.
**h2o.varimp_plot**  
Plot Variable Importances

**Description**
Plot Variable Importances

**Usage**

```r
h2o.varimp_plot(model, num_of_features = NULL)
```

**Arguments**

- `model`  
  A trained model (accepts a trained random forest, GBM, or deep learning model, will use `h2o.std_coef_plot` for a trained GLM

- `num_of_features`  
  The number of features shown in the plot (default is 10 or all if less than 10).

**See Also**

- `h2o.std_coef_plot` for GLM.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.varimp_plot(model)

# for deep learning set the variable_importance parameter to TRUE
iris_hf <- as.h2o(iris)
iris_dl <- h2o.deeplearning(x = 1:4, y = 5, training_frame = iris_hf,
variable_importances = TRUE)
h2o.varimp_plot(iris_dl)
## End(Not run)
```

**h2o.varsplits**  
Retrieve per-variable split information for a given Isolation Forest model. Output will include:  
- **count** - The number of times a variable was used to make a split.  
- **aggregated_split_ratios** - The split ratio is defined as "abs(#left_observations - #right_observations) / #before_split". Even splits (#left_observations approx the same as #right_observations) contribute less to the total aggregated split ratio value for the given feature; highly imbalanced splits (eg. #left_observations » #right_observations) contribute more.  
- **aggregated_split_depths** - The sum of all depths of a variable used to make a split. (If a variable is used on level N of a tree, then it contributes with N to the total aggregate.)
**h2o.week**

**Description**

Convert milliseconds to week of week year in H2O datasets.

**Usage**

```r
h2o.week(x)
```

**Arguments**

- `x`: An H2OFrame object.

**Value**

An H2OFrame object containing the entries of `x` converted to weeks of the week year.

**See Also**

- `h2o.month`
h2o.weights  

**Retrieve the respective weight matrix**

**Description**
Retrieve the respective weight matrix

**Usage**

```r
h2o.weights(object, matrix_id = 1)
```

**Arguments**

- `object`  
  An H2OModel or H2OModelMetrics

- `matrix_id`  
  An integer, ranging from 1 to number of layers + 1, that specifies the weight matrix to return.

h2o.which  

**Which indices are TRUE?**

**Description**
Give the TRUE indices of a logical object, allowing for array indices.

**Usage**

```r
h2o.which(x)
```

**Arguments**

- `x`  
  An H2OFrame object.

**Value**
Returns an H2OFrame object.

**See Also**

`which` for the base R method.

**Examples**

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
h2o.which(iris_hf[, 1] == 4.4)
## End(Not run)
```
**h2o.which_max**

*Which indice contains the max value?*

**Description**

Get the index of the max value in a column or row

**Usage**

h2o.which_max(x, na.rm = TRUE, axis = 0)

which.max.H2OFrame(x, na.rm = TRUE, axis = 0)

which.min.H2OFrame(x, na.rm = TRUE, axis = 0)

**Arguments**

- **x**
  - An H2OFrame object.
- **na.rm**
  - logical. Indicate whether missing values should be removed.
- **axis**
  - integer. Indicate whether to calculate the mean down a column (0) or across a row (1).

**Value**

Returns an H2OFrame object.

**See Also**

*which.max* for the base R method.

---

**h2o.which_min**

*Which index contains the min value?*

**Description**

Get the index of the min value in a column or row

**Usage**

h2o.which_min(x, na.rm = TRUE, axis = 0)

**Arguments**

- **x**
  - An H2OFrame object.
- **na.rm**
  - logical. Indicate whether missing values should be removed.
- **axis**
  - integer. Indicate whether to calculate the mean down a column (0) or across a row (1).
**h2o.withinss**

* Get the Within SS

**Description**

- Get the Within SS

**Usage**

```r
h2o.withinss(object)
```

**Arguments**

- **object**: An `H2OClusteringModel` object.

---

**h2o.word2vec**

* Trains a word2vec model on a String column of an H2O data frame

**Description**

- Trains a word2vec model on a String column of an H2O data frame

**Usage**

```r
h2o.word2vec(training_frame = NULL, model_id = NULL, 
min_word_freq = 5, word_model = c("SkipGram"), 
norm_model = c("HSM"), vec_size = 100, window_size = 5, 
sent_sample_rate = 0.001, init_learning_rate = 0.025, epochs = 5, 
pre_trained = NULL, max_runtime_secs = 0, 
export_checkpoints_dir = NULL)
```

**Arguments**

- **training_frame**: Id of the training data frame.
- **model_id**: Destination id for this model; auto-generated if not specified.
- **min_word_freq**: This will discard words that appear less than <int> times. Defaults to 5.
- **word_model**: Use the Skip-Gram model. Must be one of: "SkipGram". Defaults to SkipGram.
- **norm_model**: Use Hierarchical Softmax. Must be one of: "HSM". Defaults to HSM.
- **vec_size**: Set size of word vectors. Defaults to 100.
- **window_size**: Set max skip length between words. Defaults to 5.
sent_sample_rate
Set threshold for occurrence of words. Those that appear with higher frequency
in the training data will be randomly down-sampled; useful range is (0, 1e-5)
Defaults to 0.001.

init_learning_rate
Set the starting learning rate Defaults to 0.025.

epochs
Number of training iterations to run Defaults to 5.

pre_trained
Id of a data frame that contains a pre-trained (external) word2vec model

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable.
Defaults to 0.

export_checkpoints_dir
Automatically export generated models to this directory.

---

h2o.xgboost
Build an eXtreme Gradient Boosting model

**Description**

Builds a eXtreme Gradient Boosting model using the native XGBoost backend.

**Usage**

```r
h2o.xgboost(x, y, training_frame, model_id = NULL,
validation_frame = NULL, nfolds = 0,
keep_cross_validation_models = TRUE,
keep_cross_validation_predictions = FALSE,
keep_cross_validation_fold_assignment = FALSE,
score_each_iteration = FALSE, fold_assignment = c("AUTO", "Random",
"Modulo", "Stratified"), fold_column = NULL,
ignore_const_cols = TRUE, offset_column = NULL,
weights_column = NULL, stopping_rounds = 0,
stopping_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE",
"MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR",
"mean_per_class_error", "custom", "custom_increasing"),
stopping_tolerance = 0.001, max_runtime_secs = 0, seed = -1,
distribution = c("AUTO", "bernoulli", "multinomial", "gaussian",
"poisson", "gamma", "tweedie", "laplace", "quantile", "huber"),
tweedie_power = 1.5, categorical_encoding = c("AUTO", "Enum",
"OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder",
"SortByResponse", "EnumLimited"), quiet_mode = TRUE,
export_checkpoints_dir = NULL, ntrees = 50, max_depth = 6,
min_rows = 1, min_child_weight = 1, learn_rate = 0.3, eta = 0.3,
sample_rate = 1, subsample = 1, col_sample_rate = 1,
colsample_bylevel = 1, col_sample_rate_per_tree = 1,
colsample_bytree = 1, max_abs_leafnode_pred = 0,
max_delta_step = 0, monotone_constraints = NULL,
score_tree_interval = 0, min_split_improvement = 0, gamma = 0,
nthread = -1, save_matrix_directory = NULL, max_bins = 256,
max_leaves = 0, min_sum_hessian_in_leaf = 100,
```

min_data_in_leaf = 0, sample_type = c("uniform", "weighted"),
normalize_type = c("tree", "forest"), rate_drop = 0,
one_drop = FALSE, skip_drop = 0, tree_method = c("auto", "exact",
"approx", "hist"), grow_policy = c("depthwise", "lossguide"),
booster = c("gbtree", "gblinear", "dart"), reg_lambda = 1,
reg_alpha = 0, dmatrix_type = c("auto", "dense", "sparse"),
backend = c("auto", "gpu", "cpu"), gpu_id = 0, verbose = FALSE)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
score_each_iteration Logical. Whether to score during each iteration of model training. Defaults to FALSE.
fold_assignment Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column Column with cross-validation fold index assignment per observation.
ignore_const_cols Logical. Ignore constant columns. Defaults to TRUE.
offset_column Offset column. This will be added to the combination of columns before applying the link function.
weights_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.
stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "lift_top_group", "misclassification", "AUCPR", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

distribution
Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

tweedie_power
Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.
categorical_encoding
Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

quiet_mode
Logical. Enable quiet mode Defaults to TRUE.

export_checkpoints_dir
Automatically export generated models to this directory.

ntrees
(same as n_estimators) Number of trees. Defaults to 50.

max_depth
Maximum tree depth. Defaults to 6.

min_rows
(same as min_child_weight) Fewest allowed (weighted) observations in a leaf. Defaults to 1.

min_child_weight
(same as min_rows) Fewest allowed (weighted) observations in a leaf. Defaults to 1.

learn_rate
(same as eta) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

eta
(same as learn_rate) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

sample_rate
(same as subsample) Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

subsample
(same as sample_rate) Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

col_sample_rate
(same as colsample_bylevel) Column sample rate (from 0.0 to 1.0) Defaults to 1.

colsample_bylevel
(same as col_sample_rate) Column sample rate (from 0.0 to 1.0) Defaults to 1.
h2o.xgboost

\texttt{col\_sample\_rate\_per\_tree}
(same as \texttt{colsample\_bytree}) Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

\texttt{colsample\_bytree}
(same as \texttt{col\_sample\_rate\_per\_tree}) Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

\texttt{max\_abs\_leafnode\_pred}
(same as \texttt{max\_delta\_step}) Maximum absolute value of a leaf node prediction Defaults to 0.0.

\texttt{max\_delta\_step}
(same as \texttt{max\_abs\_leafnode\_pred}) Maximum absolute value of a leaf node prediction Defaults to 0.0.

\texttt{monotone\_constraints}
A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

\texttt{score\_tree\_interval}
Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

\texttt{min\_split\_improvement}
(same as \texttt{gamma}) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

\texttt{gamma}
(same as \texttt{min\_split\_improvement}) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

\texttt{nthread}
Number of parallel threads that can be used to run XGBoost. Cannot exceed H2O cluster limits (-nthreads parameter). Defaults to maximum available Defaults to -1.

\texttt{save\_matrix\_directory}
Directory where to save matrices passed to XGBoost library. Useful for debugging.

\texttt{max\_bins}
For tree_method=hist only: maximum number of bins Defaults to 256.

\texttt{max\_leaves}
For tree_method=hist only: maximum number of leaves Defaults to 0.

\texttt{min\_sum\_hessian\_in\_leaf}
For tree_method=hist only: the minimum sum of hessian in a leaf to keep splitting Defaults to 100.0.

\texttt{min\_data\_in\_leaf}
For tree_method=hist only: the minimum data in a leaf to keep splitting Defaults to 0.0.

\texttt{sample\_type}
For booster=dart only: sample_type Must be one of: "uniform", "weighted". Defaults to uniform.

\texttt{normalize\_type}
For booster=dart only: normalize_type Must be one of: "tree", "forest". Defaults to tree.

\texttt{rate\_drop}
For booster=dart only: rate_drop (0..1) Defaults to 0.0.

\texttt{one\_drop}
Logical. For booster=dart only: one_drop Defaults to FALSE.

\texttt{skip\_drop}
For booster=dart only: skip_drop (0..1) Defaults to 0.0.

\texttt{tree\_method}
Tree method Must be one of: "auto", "exact", "approx", "hist". Defaults to auto.

\texttt{grow\_policy}
Grow policy - depthwise is standard GBM, lossguide is LightGBM Must be one of: "depthwise", "lossguide". Defaults to depthwise.

\texttt{booster}
Booster type Must be one of: "gbtree", "gblinear", "dart". Defaults to gbtree.

\texttt{reg\_lambda}
L2 regularization Defaults to 1.0.
reg_alpha  L1 regularization. Defaults to 0.0.

dmatrix_type  Type of DMatrix. For sparse, NAs and 0 are treated equally. Must be one of: "auto", "dense", "sparse". Defaults to auto.

backend  Backend. By default (auto), a GPU is used if available. Must be one of: "auto", "gpu", "cpu". Defaults to auto.

gpu_id  Which GPU to use. Defaults to 0.

verbose  Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

h2o.xgboost.available  Determines whether an XGBoost model can be built

Description
Ask the H2O server whether a XGBoost model can be built. (Depends on availability of native backend.) Returns True if a XGBoost model can be built, or False otherwise.

Usage
h2o.xgboost.available()

h2o.year  Convert Milliseconds to Years in H2O Datasets

Description
Convert the entries of an H2OFrame object from milliseconds to years, indexed starting from 1900.

Usage
h2o.year(x)

year(x)

## S3 method for class 'H2OFrame'
year(x)

Arguments
x  An H2OFrame object.

Details
This method calls the function of the MutableDateTime class in Java.

Value
An H2OFrame object containing the entries of x converted to years

See Also
h2o.month
**H2OAutoML-class**

*The H2OAutoML class*

**Description**

This class represents an H2OAutoML object.

**H2OClusteringModel-class**

*The H2OClusteringModel object.*

**Description**

This virtual class represents a clustering model built by H2O.

**Details**

This object has slots for the key, which is a character string that points to the model key existing in the H2O cluster, the data used to build the model (an object of class H2OFrame).

**Slots**

- `model_id` A character string specifying the key for the model fit in the H2O cluster’s key-value store.
- `algorithm` A character string specifying the algorithm that was used to fit the model.
- `parameters` A list containing the parameter settings that were used to fit the model that differ from the defaults.
- `allparameters` A list containing all parameters used to fit the model.
- `model` A list containing the characteristics of the model returned by the algorithm.
  - `size` The number of points in each cluster.
  - `totss` Total sum of squared error to grand mean.
  - `withinss` A vector of within-cluster sum of squared error.
  - `tot_withinss` Total within-cluster sum of squared error.
  - `betweeness` Between-cluster sum of squared error.
The H2OConnection class.

Description

This class represents a connection to an H2O cluster.

Usage

```r
## S4 method for signature 'H2OConnection'
show(object)
```

Arguments

- `object` an H2OConnection object.

Details

Because H2O is not a master-slave architecture, there is no restriction on which H2O node is used to establish the connection between R (the client) and H2O (the server).

A new H2O connection is established via the `h2o.init()` function, which takes as parameters the 'ip' and 'port' of the machine running an instance to connect with. The default behavior is to connect with a local instance of H2O at port 54321, or to boot a new local instance if one is not found at port 54321.

Slots

- `ip` A character string specifying the IP address of the H2O cluster.
- `port` A numeric value specifying the port number of the H2O cluster.
- `name` A character value specifying the name of the H2O cluster.
- `proxy` A character specifying the proxy path of the H2O cluster.
- `https` Set this to TRUE to use https instead of http.
- `cacert` Path to a CA bundle file with root and intermediate certificates of trusted CAs.
- `insecure` Set this to TRUE to disable SSL certificate checking.
- `username` Username to login with.
- `password` Password to login with.
- `use_spnego` Set this to TRUE to use SPNEGO authentication.
- `cookies` Cookies to add to request
- `context_path` Context path which is appended to H2O server location.
- `mutable` An H2OConnectionMutableState object to hold the mutable state for the H2O connection.
H2OConnectionMutableState

The H2OConnectionMutableState class

Description

This class represents the mutable aspects of a connection to an H2O cluster.

Slots

- `session_id` A character string specifying the H2O session identifier.
- `key_count` A integer value specifying count for the number of keys generated for the `session_id`.

H2OCoxPHModel-class

The H2OCoxPHModel object.

Description

Virtual object representing H2O’s CoxPH Model.

Usage

```
# S4 method for signature 'H2OCoxPHModel'
show(object)
```

```
# S3 method for class 'H2OCoxPHModel'
coef(object, ...)
```

```
# S3 method for class 'H2OCoxPHModel'
extractAIC(fit, scale, k = 2, ...)
```

```
# S3 method for class 'H2OCoxPHModel'
logLik(object, ...)
```

```
# S3 method for class 'H2OCoxPHModel'
survfit.H2OCoxPHModel(formula, newdata, ...)
```

```
# S3 method for class 'H2OCoxPHModel'
vcov(object, ...)
```

Arguments

- `object` an H2OCoxPHModel object.
- `fit` an H2OCoxPHModel object.
- `scale` optional numeric specifying the scale parameter of the model.
- `k` numeric specifying the weight of the equivalent degrees of freedom.
- `formula` an H2OCoxPHModel object.
- `newdata` an optional H2OFrame or data.frame with the same variable names as those that appear in the H2OCoxPHModel object.
- `...` additional arguments to pass on.
The `H2OCoxPHModelSummary` object.

Description

Wrapper object for summary information compatible with survival package.

Usage

```r
## S4 method for signature 'H2OCoxPHModelSummary'
show(object)

## S3 method for class 'H2OCoxPHModelSummary'
coef(object, ...)
```

Arguments

- `object` An `H2OCoxPHModelSummary` object.
- `...` additional arguments to pass on.

Slots

- `summary` A list containing the a summary compatible with CoxPH summary used in the survival package.

The `H2OFrame` class

Description

This class represents an H2OFrame object

Extract or Replace Parts of an H2OFrame Object

Description

Operators to extract or replace parts of H2OFrame objects.
### Usage

```r
## S3 method for class 'H2OFrame'
data[row, col, drop = TRUE]
## S3 method for class 'H2OFrame'
x$name
## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]
## S3 method for class 'H2OFrame'
x$name
## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]
## S3 replacement method for class 'H2OFrame'
data[row, col, ...] <- value
## S3 replacement method for class 'H2OFrame'
data$name <- value
## S3 replacement method for class 'H2OFrame'
data[[name]] <- value
```

### Arguments

- **data**: object from which to extract element(s) or in which to replace element(s).
- **row**: index specifying row element(s) to extract or replace. Indices are numeric or character vectors or empty (missing) or will be matched to the names.
- **col**: index specifying column element(s) to extract or replace.
- **drop**: Unused
- **x**: An H2OFrame
- **name**: a literal character string or a name (possibly backtick quoted).
- **i**: index
- **exact**: controls possible partial matching of `[]` when extracting a character
- **...**: Further arguments passed to or from other methods.
- **value**: To be assigned

---

### H2OGrid-class

**H2O Grid**

A class to contain the information about grid results
H2OLeafNode-class

Usage

## S4 method for signature 'H2OGrid'
show(object)

Arguments

object an H2OGrid object.

Slots

grid_id the final identifier of grid
model_ids list of model IDs which are included in the grid object
hyper_names list of parameter names used for grid search
failed_params list of model parameters which caused a failure during model building, it can contain a null value
failure_details list of detailed messages which correspond to failed parameters field
failure_stack_traces list of stack traces corresponding to model failures reported by failed_params and failure_details fields
failed_raw_params list of failed raw parameters
summary_table table of models built with parameters and metric information.

See Also

H2OModel for the final model types.

Description

This class represents a single leaf node in an H2OTree.

Details

#' @aliases H2OLeafNode
### H2OModel-class

#### Description

This virtual class represents a model built by H2O.

#### Usage

```r
## S4 method for signature 'H2OModel'
show(object)
```

#### Arguments

- `object` an `H2OModel` object.

#### Details

This object has slots for the key, which is a character string that points to the model key existing in the H2O cluster, the data used to build the model (an object of class `H2OFrame`).

#### Slots

- `model_id` A character string specifying the key for the model fit in the H2O cluster's key-value store.
- `algorithm` A character string specifying the algorithm that were used to fit the model.
- `parameters` A list containing the parameter settings that were used to fit the model that differ from the defaults.
- `allparameters` A list containing all parameters used to fit the model.
- `have_pojo` A logical indicating whether export to POJO is supported.
- `have_mojo` A logical indicating whether export to MOJO is supported.
- `model` A list containing the characteristics of the model returned by the algorithm.

### H2OModelFuture-class

#### Description

A class to contain the information for background model jobs.

#### Slots

- `job_key` a character key representing the identification of the job process.
- `model_id` the final identifier for the model

#### See Also

- `H2OModel` for the final model types.
H2OModelMetrics-class  The H2OModelMetrics Object.

**Description**

A class for constructing performance measures of H2O models.

**Usage**

```r
## S4 method for signature 'H2OModelMetrics'
show(object)

## S4 method for signature 'H2OBinomialMetrics'
show(object)

## S4 method for signature 'H2OMultinomialMetrics'
show(object)

## S4 method for signature 'H2OOrdinalMetrics'
show(object)

## S4 method for signature 'H2ORegressionMetrics'
show(object)

## S4 method for signature 'H2OClusteringMetrics'
show(object)

## S4 method for signature 'H2OAutoEncoderMetrics'
show(object)

## S4 method for signature 'H2ODimReductionMetrics'
show(object)
```

**Arguments**

- `object`  
  An `H2OModelMetrics` object

H2ONode-class  The H2ONode class.

**Description**

The H2ONode class.

**Usage**

```r
## S4 method for signature 'H2ONode'
show(object)
```
H2OSplitNode-class

Arguments

object  an H2ONode object.

Slots

id  An integer representing node's unique identifier. Generated by H2O.
levels  A character representing categorical levels on split from parent’s node belonging into this node. NULL for root node or non-categorical splits.

H2OSplitNode-class  The H2OSplitNode class.

Description

This class represents a single non-terminal node in an H2OTree.

Slots

threshold  A numeric split threshold, typically when the split column is numerical.
left_child  A H2ONodeOrNULL representing the left child node, if a node has one.
right_child  A H2ONodeOrNULL representing the right child node, if a node has one.
split_feature  A character representing the name of the column this node splits on.
left_levels  A character representing the levels of a categorical feature heading to the left child of this node. NA for non-categorical split.
right_levels  A character representing the levels of a categorical feature heading to the right child of this node. NA for non-categorical split.
na_direction  A character representing the direction of NA values. LEFT means NA values go to the left child node, RIGH means NA values go to the right child node.

H2OTree-class  The H2OTree class.

Description

This class represents a model of a Tree built by one of H2O’s algorithms (GBM, Random Forest).

Usage

## S4 method for signature 'H2OTree'
show(object)

Arguments

object  an H2OTree object.
Slots

root_node A H2ONode representing the beginning of the tree behind the model. Allows further
tree traversal.
left_children An integer vector with left child nodes of tree's nodes
right_children An integer vector with right child nodes of tree's nodes
node_ids An integer representing identification number of a node. Node IDs are generated by
H2O.
descriptions A character vector with descriptions for each node to be found in the tree. Cont-
tains split threshold if the split is based on numerical column. For cactegorical splits, it con-
tains list of categorical levels for transition from the parent node.
model_id A character with the name of the model this tree is related to.
tree_number An integer representing the order in which the tree has been built in the model.
tree_class A character representing name of tree's class. Number of tree classes equals to the
number of levels in categorical response column. As there is exactly one class per categorical
level, name of tree's class equals to the corresponding categorical level of response column.
In case of regression and binomial, the name of the categorical level is ignored can be omitted,
as there is exactly one tree built in both cases.
thresholds A numeric split thresholds. Split thresholds are not only related to numerical splits,
but might be present in case of categorical split as well.
features A character with names of the feature/column used for the split.
levels A character representing categorical levels on split from parent's node belonging into
this node. NULL for root node or non-categorical splits.
nas A character representing if NA values go to the left node or right node. May be NA if node
is a leaf.
predictions A numeric representing predictions for each node in the graph.

---

housevotes United States Congressional Voting Records 1984

Description

This data set includes votes for each of the U.S. House of Representatives Congressmen on the 16
key votes identified by the CQA. The CQA lists nine different types of votes: voted for, paired
for, and announced for (these three simplified to yea), voted against, paired against, and announced
against (these three simplified to nay), voted present, voted present to avoid conflict of interest, and
did not vote or otherwise make a position known (these three simplified to an unknown disposition).

Format

A data frame with 435 rows and 17 columns

is.factor  
*Check if factor*

**Description**
Check if factor

**Usage**

```r
is.factor(x)
```

**Arguments**

- `x`  
  An H2OFrame object

---

is.h2o  
*Is H2O Frame object*

**Description**
Test if object is H2O Frame.

**Usage**

```r
is.h2o(x)
```

**Arguments**

- `x`  
  An R object.

---

is.numeric  
*Check if numeric*

**Description**
Check if numeric

**Usage**

```r
is.numeric(x)
```

**Arguments**

- `x`  
  An H2OFrame object
**Keyed-class**

<table>
<thead>
<tr>
<th>Keyed-class</th>
<th>Virtual Keyed class</th>
</tr>
</thead>
</table>

**Description**

Base class for all objects having a persistent representation on backend.

**length,H2OTree-method**

Overrides the behavior of length() function on H2OTree class. Returns number of nodes in an H2OTree.

**Description**

Overrides the behavior of length() function on H2OTree class. Returns number of nodes in an H2OTree.

**Usage**

```r
## S4 method for signature 'H2OTree'
length(x)
```

**Arguments**

- `x` An H2OTree to count nodes for.

**Logical-or**

Logical or for H2OFrames.

**Description**

Logical or for H2OFrames.

**Usage**

```
"||"(x, y)
```

**Arguments**

- `x` An H2OFrame object
- `y` An H2OFrame object
ModelAccessors  Accessor Methods for H2OModel Object

Description
Function accessor methods for various H2O output fields.

Usage

getParms(object)

## S4 method for signature 'H2OModel'
getParms(object)

getCenters(object)

getCentersStd(object)

getWithinSS(object)

getTotWithinSS(object)

getBetweenSS(object)

getTotSS(object)

getBetweenSS(object)

## S4 method for signature 'H2OClusteringModel'
getTotSS(object)

## S4 method for signature 'H2OClusteringModel'
getIterations(object)
getClusterSizes(object)

Arguments

object an H2OModel class object.

Description

Column names of an H2OFrame

Usage

names(x)

Arguments

x An H2OFrame

Ops.H2OFrame S3 Group Generic Functions for H2O

Description

Methods for group generic functions and H2O objects.

Usage

Ops(e1, e2)

Math(x, ...)

Math(x, ...)

Math(x, ...)

Summary(x, ..., na.rm)

!x
## plot.H2OModel

### Description

Plots training set (and validation set if available) scoring history for an H2O Model

### Arguments

- `e1` object
- `e2` object
- `x` object
- `...` Further arguments passed to or from other methods.
- `na.rm` logical. whether or not missing values should be removed
- `y` object
- `value` To be assigned

---

**plot.H2OModel**  
*Plot an H2O Model*
Usage

```r
## S3 method for class 'H2OModel'
plot(x, timestep = "AUTO", metric = "AUTO", ...)
```

Arguments

- `x`: A fitted H2OModel object for which the scoring history plot is desired.
- `timestep`: A unit of measurement for the x-axis.
- `metric`: A unit of measurement for the y-axis.
- `...`: additional arguments to pass on.

Details

This method dispatches on the type of H2O model to select the correct scoring history. The timestep and metric arguments are restricted to what is available in the scoring history for a particular type of model.

Value

Returns a scoring history plot.

See Also

`h2o.deeplearning`, `h2o.gbm`, `h2o.glm`, `h2o.randomForest` for model generation in h2o.

Examples

```r
## Not run:
if (requireNamespace("mlbench", quietly=TRUE)) {
  library(h2o)
  h2o.init()

  df <- as.h2o(mlbench::mlbench.friedman1(10000,1))
  rng <- h2o.runif(df, seed=1234)
  train <- df[rng<0.8,]
  valid <- df[rng>=0.8,]

  gbm <- h2o.gbm(x = 1:10, y = "y", training_frame = train, validation_frame = valid,
               ntrees=500, learn_rate=0.01, score_each_iteration = TRUE)
  plot(gbm)
  plot(gbm, timestep = "duration", metric = "deviance")
  plot(gbm, timestep = "number_of_trees", metric = "deviance")
  plot(gbm, timestep = "number_of_trees", metric = "rmse")
  plot(gbm, timestep = "number_of_trees", metric = "mae")
}
## End(Not run)
```
Description

Plots the simple co-occurrence based tabulation of X vs Y as a heatmap, where X and Y are two Vecs in a given dataset. This function requires suggested ggplot2 package.

Usage

```r
## S3 method for class 'H2OTabulate'
plot(x, xlab = x$cols[1], ylab = x$cols[2],
     base_size = 12, ...)
```

Arguments

- `x`: An H2OTabulate object for which the heatmap plot is desired.
- `xlab`: A title for the x-axis. Defaults to what is specified in the given H2OTabulate object.
- `ylab`: A title for the y-axis. Defaults to what is specified in the given H2OTabulate object.
- `base_size`: Base font size for plot.
- `...`: additional arguments to pass on.

Value

Returns a ggplot2-based heatmap of co-occurrence.

See Also

`h2o.tabulate`

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- as.h2o(iris)
tab <- h2o.tabulate(data = df, x = "Sepal.Length", y = "Petal.Width",
                   weights_column = NULL, nbins_x = 10, nbins_y = 10)
plot(tab)
## End(Not run)
```
**predict.H2OAutoML**

*Predict on an AutoML object*

**Description**

Obtains predictions from an AutoML object.

**Usage**

```r
## S3 method for class 'H2OAutoML'
predict(object, newdata, ...)
```

```r
## S3 method for class 'H2OAutoML'
h2o.predict(object, newdata, ...)
```

**Arguments**

- `object` a fitted `H2OAutoML` object for which prediction is desired
- `newdata` An H2OFrame object in which to look for variables with which to predict.
- `...` additional arguments to pass on.

**Details**

This method generated predictions on the leader model from an AutoML run. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

**Value**

Returns an H2OFrame object with probabilities and default predictions.

---

**predict.H2OModel**

*Predict on an H2O Model*

**Description**

Obtains predictions from various fitted H2O model objects.

**Usage**

```r
## S3 method for class 'H2OModel'
predict(object, newdata, ...)
```

```r
## S3 method for class 'H2OModel'
h2o.predict(object, newdata, ...)
```

**Details**

This method generated predictions on the leader model from an AutoML run. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).
predict_contributions.H2OModel

Arguments

- **object**: a fitted H2OModel object for which prediction is desired
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **...**: additional arguments to pass on.

Details

This method dispatches on the type of H2O model to select the correct prediction/scoring algorithm. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

Value

Returns an H2OFrame object with probabilities and default predictions.

See Also

h2o.deeplearning, h2o.gbm, h2o.glm, h2o.randomForest for model generation in h2o.

Description

Returned H2OFrame has shape (#rows, #features + 1) - there is a feature contribution column for each input feature, the last column is the model bias (same value for each row). The sum of the feature contributions and the bias term is equal to the raw prediction of the model. Raw prediction of tree-based model is the sum of the predictions of the individual trees before the inverse link function is applied to get the actual prediction. For Gaussian distribution the sum of the contributions is equal to the model prediction.

Usage

predict_contributions.H2OModel(object, newdata, ...)

h2o.predict_contributions(object, newdata, ...)

Arguments

- **object**: a fitted H2OModel object for which prediction is desired
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **...**: additional arguments to pass on.

Details

Note: Multinomial classification models are currently not supported.
**Value**

Returns an H2OFrame contain feature contributions for each input row.

**See Also**

`h2o.gbm` and `h2o.randomForest` for model generation in h2o.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_gbm <- h2o.gbm(3:9, "AGE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.predict_contributions(prostate_gbm, prostate)
## End(Not run)
```

---

**predict_leaf_node_assignment.H2OModel**

*Predict the Leaf Node Assignment on an H2O Model*

**Description**

Obtains leaf node assignment from fitted H2O model objects.

**Usage**

```r
predict_leaf_node_assignment.H2OModel(object, newdata, type = c("Path", "Node_ID"), ...)
```

```r
h2o.predict_leaf_node_assignment(object, newdata, type = c("Path", "Node_ID"), ...)
```

**Arguments**

- `object` a fitted `H2OModel` object for which prediction is desired
- `newdata` An H2OFrame object in which to look for variables with which to predict.
- `type` choice of either "Path" when tree paths are to be returned (default); or "Node_ID" when the output
- `...` additional arguments to pass on.

**Details**

For every row in the test set, return the leaf placements of the row in all the trees in the model. Placements can be represented either by paths to the leaf nodes from the tree root or by H2O’s internal identifiers. The order of the rows in the results is the same as the order in which the data was loaded.
Value

Returns an H2OFrame object with categorical leaf assignment identifiers for each tree in the model.

See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.predict_leaf_node_assignment(prostate_gbm, prostate)

## End(Not run)
```

print.H2OFrame

Print An H2OFrame

Description

Print An H2OFrame

Usage

```r
## S3 method for class 'H2OFrame'
print(x, n = 6L, ...)
```

Arguments

- `x` An H2OFrame object
- `n` An (Optional) A single integer. If positive, number of rows in `x` to return. If negative, all but the `n` first/last number of rows in `x`. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).
- `...` Further arguments to be passed from or to other methods.
**print.H2OTable**  
*Print method for H2OTable objects*

---

**Description**

This will print a truncated view of the table if there are more than 20 rows.

**Usage**

```r
## S3 method for class 'H2OTable'
print(x, header = TRUE, ...)
```

**Arguments**

- `x` An H2OTable object
- `header` A logical value dictating whether or not the table name should be printed.
- `...` Further arguments passed to or from other methods.

**Value**

The original x object

---

**prostate**  
*Prostate Cancer Study*

---

**Description**

Baseline exam results on prostate cancer patients from Dr. Donn Young at The Ohio State University Comprehensive Cancer Center.

**Format**

A data frame with 380 rows and 9 columns

**Source**

range.H2OFrame  

**Range of an H2O Column**

**Description**

Range of an H2O Column

**Usage**

```r
## S3 method for class 'H2OFrame'
range(..., na.rm = TRUE)
```

**Arguments**

- `...`: An H2OFrame object.
- `na.rm`: Ignore missing values

scale  

**Scaling and Centering of an H2OFrame**

**Description**

Centers and/or scales the columns of an H2O dataset.

**Usage**

```r
## S3 method for class 'H2OFrame'
scale(x, center = TRUE, scale = TRUE)
```

**Arguments**

- `x`: An H2OFrame object.
- `center`: Either a logical value or numeric vector of length equal to the number of columns of `x`.
- `scale`: Either a logical value or numeric vector of length equal to the number of columns of `x`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- scale(iris_hf[, 1:4])

## End(Not run)
```
staged_predict_proba.H2OModel

Predict class probabilities at each stage of an H2O Model

Description

The output structure is analogous to the output of `h2o.predict_leaf_node_assignment`. For each tree \( t \) and class \( c \) there will be a column \( T_t.C_c \) (eg. \( T_3.C_1 \) for tree 3 and class 1). The value will be the corresponding predicted probability of this class by combining the raw contributions of trees \( T_1.C_c, ..., T_i.C_c \). Binomial models build the trees just for the first class and values in columns \( T_x.C_1 \) thus correspond to the probability \( p_0 \).

Usage

```r
staged_predict_proba.H2OModel(object, newdata, ...)  
h2o.staged_predict_proba(object, newdata, ...)
```

Arguments

- **object**: a fitted `H2OModel` object for which prediction is desired
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **...**: additional arguments to pass on.

Value

Returns an H2OFrame object with predicted probability for each tree in the model.

See Also

- `h2o.gbm` and `h2o.randomForest` for model generation in h2o.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.staged_predict_proba(prostate_gbm, prostate)
## End(Not run)
```
str.H2OFrame

Display the structure of an H2OFrame object

Description

Display the structure of an H2OFrame object

Usage

```r
## S3 method for class 'H2OFrame'
str(object, ..., cols = FALSE)
```

Arguments

- `object`: An H2OFrame.
- `...`: Further arguments to be passed from or to other methods.
- `cols`: Print the per-column str for the H2OFrame.

summary.H2OCoxPHModel-method

Summary method for H2OCoxPHModel objects

Description

Summary method for H2OCoxPHModel objects

Usage

```r
## S4 method for signature 'H2OCoxPHModel'
summary(object, conf.int = 0.95, scale = 1)
```

Arguments

- `object`: an H2OCoxPHModel object.
- `conf.int`: a specification of the confidence interval.
- `scale`: a scale.
**summary,H2OGrid-method**

*Format grid object in user-friendly way*

**Description**

Format grid object in user-friendly way

**Usage**

```r
## S4 method for signature 'H2OGrid'
summary(object, show_stack_traces = FALSE)
```

**Arguments**

- `object`: an H2OGrid object.
- `show_stack_traces`: a flag to show stack traces for model failures

**summary,H2OModel-method**

*Print the Model Summary*

**Description**

Print the Model Summary

**Usage**

```r
## S4 method for signature 'H2OModel'
summary(object, ...)
```

**Arguments**

- `object`: An H2OModel object.
- `...`: further arguments to be passed on (currently unimplemented)
## Description

Testing availability of optional package, its version, and extra global default. This function is used internally. It is exported and documented because user can control behavior of the function by global option.

## Usage

```r
use.package(package, version = "1.9.8"[package == "data.table"],
            use = getOption("h2o.use.data.table", FALSE)[package == "data.table"])
```

## Arguments

- **package**: character scalar name of a package that we Suggests or Enhances on.
- **version**: character scalar required version of a package.
- **use**: logical scalar, extra escape option, to be used as global option.

## Details

We use this function to control csv read/write with optional `data.table` package. Currently data.table is disabled by default, to enable it set `options("h2o.use.data.table"=TRUE)`. It is possible to control just `fread` or `fwrite` with `options("h2o.fread"=FALSE, "h2o.fwrite"=FALSE)`. `h2o.fread` and `h2o.fwrite` options are not handled in this function but next to `fread` and `fwrite` calls.

## See Also

`as.h2o.data.frame`, `as.data.frame.H2OFrame`

## Examples

```r
op <- options("h2o.use.data.table" = TRUE)
if (use.package("data.table")) {
  cat("optional package data.table 1.9.8+ is available\n")
} else {
  cat("optional package data.table 1.9.8+ is not available\n")
}
options(op)
```
Muscular Actuations for Walking Subject

Description

The musculoskeletal model, experimental data, settings files, and results for three-dimensional, muscle-actuated simulations at walking speed as described in Hamner and Delp (2013). Simulations were generated using OpenSim 2.4. The data is available from https://simtk.org/project/xml/downloads.xml?group_id=603.

Format

A data frame with 151 rows and 124 columns

References

Shutdown H2O cluster after examples run

Description

Shutdown H2O cluster after examples run

Examples

```r
## Not run:
library(h2o)
h2o.init()
h2o.shutdown(prompt = FALSE)
Sys.sleep(3)
## End(Not run)
```

Logical and for H2OFrames

Description

Logical and for H2OFrames

Usage

```
```

Arguments

- `x`: An H2OFrame object
- `y`: An H2OFrame object
